

Millipedes, unlike centipedes, are not venomous and are predominantly considered to be non-poisonous. However, there are some millipede species that produce irritating fluids from glands located on the side of their body.

Although they do not bite, some millipedes defend themselves another way. They produce an unpleasant-smelling liquid from glands on their sides. ... The liquid can cause small blisters on the skin of people who try to handle certain millipedes.

Most millipedes have 750 legs!
