Clarity Can Be Hard to Achieve (on the first go-round)

When healthcare providers convey important information about prescribed medications, there is no guarantee that patients fully understand both the benefits and potential risks of starting the treatment.

How often do we walk out of a doctor’s office asking, “What did the doctor or nurse say again about this medicine?”
Patient
OK—I take this medicine 3 times a day. Then if I get nauseous I can...” What did she just say—and there’s a second medicine? Do these two go together? I don’t understand... How much longer is this going to take? Oh—she just asked if I had questions... I really need to get going.

Doctor
These instructions are pretty straight-forward. Why do I get the feeling that this patient isn’t listening? Better ask if he has questions...

“No questions right now. Thank you for your time.”

“Take this medication 3 times a day. If you get nauseous, you can take it with food, but not after 8:00 pm. Take this second medication twice a day without food, but not before 8:00 am or after 11:00 pm. And that’s it. If you have questions, call me.”

“Any Questions?”
Enhanced Medicine Communications: Benefits

Increasing communications can help patients:

- **Understand** medication side effects—for example, which ones, if any, will go away with time and those that may be experienced for the duration of being on the medicine.
- **Avoid** adverse drug reactions.
- **Improve** adherence to medicine regimen(s).
- **Live** healthier lives.
What we know about the communications gaps between patients and their healthcare providers
Lack of Medicine Communications Can Have Negative Health Consequences*

- **Nearly half** of Americans take prescription medicines, and more than **20 percent** of Americans take at least three.

- However, a research survey of 2,000 adults found that only **56 percent** of patients report high to very high adherence to medication regimens (i.e., taking their medication regularly, as prescribed); and

- Approximately **62 percent** of patients were **not aware of any safety warnings** about their medicines.

- In fact, **ten percent** of patients unaware of the possibility of a severe side effect actually experience a serious reaction.

Lack of Medicine Communications Can Have Negative Economic Consequences

The cycle of medication non-adherence and lack of effective patient-healthcare provider communication about medications has long-term implications, contributing to as much as $290 billion per year in avoidable medical spending or 13 percent of total healthcare expenditures*.
