Preplant

- Soft red winter is the main class planted in Tennessee.
  - Well-established market.
  - Generally used for general-purpose milling, pastry and cake flour.
- Adequate winter hardiness to survive lowest normal winter temps.
  - Very low temps may kill aboveground material, but growth should resume in spring.
- Best adapted to well-drained, medium to heavy soils high in fertility.
- Requires firm seedbed. If conventional, shallow (2-4 inches) disking following row crops is sufficient for seedbed prep.
  - Some form of minimum till often helps improve seed/soil contact and thus stands in heavy residue.

Variety Selection

- Plant four to five varieties that represent a range of maturities over multiple planting dates.
- Certified seed provides insurance against poor germ and contamination with weed seeds.
- Earlier maturing varieties will joint and head earlier and are therefore more susceptible to stem and head freeze in spring if planted too early.

Weed Control

- Wild garlic, annual ryegrass and cheat are problem weeds in Tennessee wheat fields.
  - Wild garlic can result in dockage at harvest.
  - Ryegrass and cheat compete for light and nutrients.

Use of weed-free seed, proper seeding rate, proper seedbed preparation and following a good weed management program in the summer crop will assist in effective weed control.

A detailed procedure for controlling wild garlic in wheat is contained in PB 1580 (link below).

A burndown prior to planting may be necessary in no-till production to desiccate remaining summer weeds and possibly winter annuals.
  - Application will result in easier planting and reduce competition with emerging wheat.

Planting

- Ideal planting dates in Tennessee typically fall between Oct. 15 and Nov. 10.
  - Do not plant prior to fly-free date of Oct. 15.
  - Planting during latter half of window or applying systemic insecticide reduces incidence of barley yellow dwarf virus.
  - Late planted wheat has a shallower root system and is more susceptible to frost heaving and winter-kill.
- Above dates should allow 3-4 inches of top growth to develop prior to the start of winter (Dec. 21).
- Target depth is 1-1.5 inches, with deeper depths to reach moisture during dry conditions. Do not exceed 2 inches.
- Target plant population should fall between 1.2 to 1.5 million plants/ac.
- Determine seeding rate (lb seed/ac) for target plant population (P#/ac) with germination test as follows:
  \[ \frac{\text{Target P#/ac}}{\text{(#seed/lb)*100}} = \text{seed/ac} \]
  \[ \frac{\text{#seed/ac}}{\text{lb seed/ac}} = \text{lb seed/ac} \]
  - Ex: (1.4 mill P/ac) / (80% germ) * 100 = 1.75 mill sd/ac
  - (1,750,000 sd/ac)/(12,000 sd/lb)= 145.8 lb sd/ac
- Up rate by 30-50% if planting in adverse conditions, if broadcasting, or if using bin-run seed.

Growth Stages

- Understanding growth stage is crucial for properly timing nitrogen, fungicides, herbicides, etc.

Fertility

Soil Sampling
- Soil tests are critical to understanding making economical fertilizer application decisions.
- Samples should be collected:
  - By proper, clean equipment.
  - In a zig-zag pattern across the grid/zone.
  - Consist of an adequate sample number.
  - Be air dried (if wet) prior to sending.

Lime and pH
- The target pH range for wheat is 6.1-6.5.
  - At pH < 5.6, chances for a response to lime are high; therefore, liming at a pH in this range is strongly encouraged to increase soil pH and avoid yield reductions.

Nitrogen (N)
- Apply 15-30 lb N starter to support early growth.
- Apply 60-90 lb N as top-dressing Feb. 15-March 30.
- All N should be applied prior to jointing.
- No difference in N source has been noted.
  - If using urea or urea ammonium nitrate (UAN) the use of an NBPT additive can reduce loss under conditions supporting volatilization.

Potassium (K) and Phosphorus (P)

Insect Thresholds/Control
- **Corn Leaf, Oat-bird Cherry and Rice Root Aphid**
  - No threshold; trigger when heavy populations cause leaves to dry up in several areas of field.
  - Seed treatment or foliar insecticide during fall/late winter can help reduce transmission of barley yellow dwarf virus and has shown a significant increase in yield over the past 10 years.

- **Greenbug**
  - Treat when aphids are killing three or more leaves per plant OR
    - If wheat is less than 6 inches tall, treat when greenbugs exceed 50 per row ft.
    - If wheat is between 6 and 10 inches tall, treat when greenbugs exceed 200 per row ft.

- **Armyworms**
  - Treat fall armyworms when four or more larvae are present per square foot.
  - Treat when true armyworms (spring) exceed 6-8 larvae per square foot. Treatment thresholds increase past milk stage given larvae are not cutting wheat heads.

- **Hessian Fly**
  - Foliar applications are only marginally effective.
  - Plant after fly free date and use resistant varieties when possible.
  - Seed treatments at the highest labeled rate will help control fall infestations.

- **Cereal Leaf Beetle**
  - Treat when 25 or more larvae are present per 100 tillers and wheat is still in the milk stage.

Diseases/Management
- **Growing wheat in 2-year intervals and planting at recommended populations can reduce infection.**

Diseases affecting heads and grain
- **Fusarium head blight**: Plant resistant varieties, avoid planting into corn residue, use foliar fungicides.
- **Loose smut**: Fungicide seed treatment, disease-free seed sources.
- **Sooty mold**: Management not usually needed

Diseases affecting leaves
- **Barley Yellow Dwarf**: Virus transmitted by aphids. Partial control can be attained by delayed planting date and foliar- or seed-applied insecticides.
- **Stripe and Leaf Rust**: Plant resistant varieties, use foliar fungicides.
- **Septoria Leaf Blotch and Stagonospora Glume Blotch**: Genetic resistance, use foliar fungicides.

Diseases affecting lower stems and roots
- **Fusarium and Common Root Rot**: Crop rotation, control grassy weeds.
- **Eyespot**: Genetic resistance, foliar fungicides, and avoid planting into wheat residues.
- **Rhizoctonia Root Rot**: Crop rotation, control grassy weeds two weeks prior to planting.
- **Take-all**: Crop rotation, control grassy weeds.

Harvest
- **No moisture-based price discount if ≤13.5 percent.**
- **Grain is ripe and harvest ready when moisture ≤ 14 percent.**
- **Delaying harvest can reduce test weights.**
- **Safe storage moisture for high viability/vigor is ≤12 percent.**
