Department of Agricultural and Resource Economics

2018

This publication provides estimates of the total (multiplier-based) economic impact of agriculture in Jackson County.<sup>2</sup> This analysis accounts for the total effect of county agriculture throughout the local economy. Economic impact is measured in terms of: 1) output or revenue (the value of sales of all local goods and services) and 2) employment.<sup>3</sup>

## DEFINITIONS

**Agriculture:** Crop and livestock production (i.e., farming); food and fiber processing, such as ice cream plants and textile mills; farm inputs, such as fertilizer plants and feed mills; and forestry-based products, such as sawmills and paper mills.

**Multiplier Effect:** Impact on the non-agricultural part of the economy. Examples of the multiplier effect include farmers and other agricultural businesses purchasing local inputs (e.g., utilities), and local spending by agricultural workers and owner-operators.

**Output:** Revenue (value of sales) of all local goods and services.

For Jackson County in 2015:

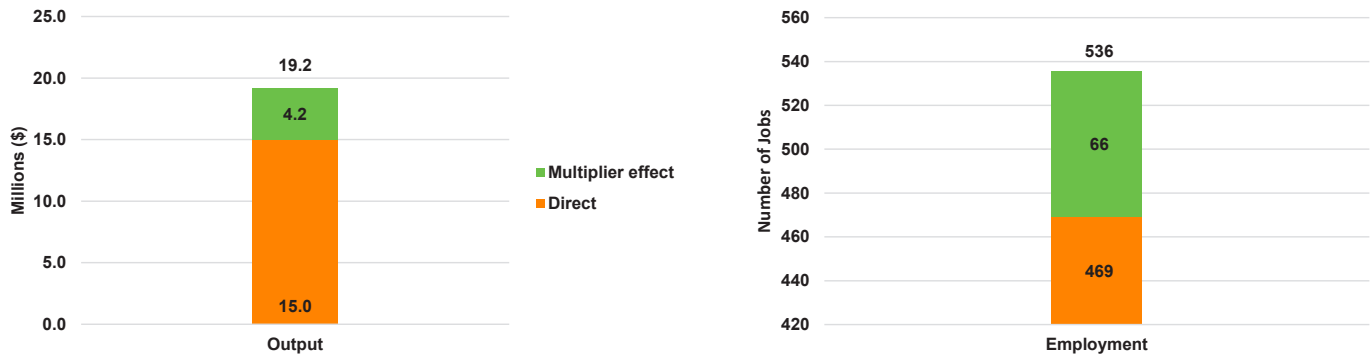

1) Total direct agricultural output is estimated at \$15.0 million. With multiplier effects, agricultural output has a total estimated economic impact of \$19.2 million. This means, for every dollar of direct output from agriculture, the total economic impact on the county's economy is \$1.28 (i.e., the 19.2 divided by the 15.0) (Figure 1, "Output").

2) There are 469 workers employed in county agriculture. With multiplier effects, an estimated 536 jobs are generated by county agriculture, or one direct agricultural job leads to 1.14 jobs (i.e., 536 divided by 469) in the county (Figure 1, "Employment").

<sup>2</sup>Additional information regarding county farming can be found in the most recent (2012) Agricultural Census at the following: [Jackson County](#)

<sup>3</sup>See Hughes (2018) for an explanation of the model used. See Menard et al. (2016) for state-level impacts.

**Figure 1.** Agriculture’s impact on Jackson County output and employment, 2015.

The *output multiplier* is \$1.28. A dollar of output in agriculture leads to \$1.28 in county-level output (i.e., the dollar plus the \$0.28 multiplier effect).  
 The *employment multiplier* is 1.14. A job in agriculture leads to 1.14 in county-level jobs (i.e., the job plus the 0.14 multiplier).
