INTRODUCTION

This manual contains the 2020 University of Tennessee weed control recommendations for corn, grain sorghum, cotton, soybean, burley and dark tobacco, wheat, forage crops, and farm ponds. These recommendations are based on results of research and demonstrations conducted by UT AgResearch and UT Extension. Decisions regarding recommendations are made by the University of Tennessee Weed Control Committee and are based on three years of data at various locations in the state.

Disclaimer
This publication contains pesticide recommendations that are subject to change at any time. The recommendations in this publication are provided only as a guide. It is always the pesticide applicator's responsibility, by law, to read and follow all current label directions for the specific pesticide being used. The label always takes precedence over the recommendations found in this publication.

Use of trade or brand names in this publication is for clarity and information; it does not imply approval of the product to the exclusion of others that may be of similar, suitable composition, nor does it guarantee or warrant the standard of the product. The author(s), the University of Tennessee Institute of Agriculture and University of Tennessee Extension assume no liability resulting from the use of these recommendations.
# TABLE OF CONTENTS

**Introduction** ......................................................................................................................................................................................... 2

**Expected Weed and Cover Crop Response to Burndown Herbicides** ......................................................................................................................... 5

**Glyphosate-Resistant Barnyardgrass/Junglerice Management Systems** ................................................................................................................. 6

**Glyphosate-Resistant Palmer Amaranth Management Systems** .............................................................................................................................................. 10

**Corn Weed Control** .............................................................................................................................................................................................. 12

- Burndown Herbicides Recommended for No-till Corn .................................................................................................................................................. 12
- Preemergence Herbicide Tank Mixtures or Package Mixes for No-till or Conventional Corn .......................................................................................... 13
- Postemergence Herbicides Recommended for Corn ........................................................................................................................................... 15
- Corn Harvest Aids .................................................................................................................................................................................. 18
- Expected Weed Response to Soil Applied Corn Herbicides ..... 19
- Expected Weed Response to Postemergence Corn Herbicides ........................................................................................................................................ 20

**Grain Sorghum Weed Control** ..................................................................................................................................................................................... 21

- Burndown Herbicides Recommended for No-till Grain Sorghum ............................................................................................................................... 22
- Preemergence Herbicides for Grain Sorghum .................................................................................................................................................. 23
- Postemergence Herbicides for Grain Sorghum ........................................................................................................................................... 24
- Grain Sorghum Harvest Aids .................................................................................................................................................................................. 25
- Expected Herbicide Response of Common Weeds in Grain Sorghum ....................................................................................................................... 26

**Cotton Weed Control** .............................................................................................................................................................................................. 27

- No-till Cotton Weed Control Considerations .................................................................................................................................................. 27
- Preplant Herbicides for Burndown and Residual Weed Control in Cotton ............................................................................................................... 28
- Preplant Incorporated Herbicides for Conventional Tillage Cotton ......................................................................................................................... 29
- Burndown Herbicides for No-Till Cotton .................................................................................................................................................. 29
- Preemergence Herbicides for Conventional or No-Till Cotton ................................................................................................................................ 30
- Overtop Herbicides for Cotton ...................................................................................................................................................................... 31
- Post-Directed Herbicides Recommended for Cotton ........................................................................................................................................ 33
- Herbicides Recommended for Use in Hooded Sprayers ...................................................................................................................................... 35
- Layby Herbicides Recommended for Cotton .................................................................................................................................................. 36
- Expected Weed Response to Cotton Herbicides .................................................................................................................................................. 37

**Soybean Weed Control** .............................................................................................................................................................................................. 38

- Burndown Herbicides for No-till Soybean .................................................................................................................................................. 38
- Preplant Incorporated Herbicides for Soybean .................................................................................................................................................. 39
- Preplant/Preemergence Herbicides for Soybean .......................................................................................................................................... 40
- Postemergence Herbicides for Weed Control in Soybean ................................................................................................................................ 41
- Soybean Harvest Aids .................................................................................................................................................................................. 45
- Expected Soil Applied Herbicide Response of Common Weeds in Soybean ................................................................................................................ 46
- Expected Weed Response from Postemergence Soybean Herbicides ................................................................................................................. 47

**Burley and Dark Tobacco Weed Control** ........................................................................................................................................................................ 48

- Herbicides for Tobacco Fields ...................................................................................................................................................................... 48
- Expected Herbicide Response of Common Weeds in Tobacco ................................................................................................................................................ 52
**EXPECTED WEED AND COVER CROP RESPONSE TO BURNDOWN HERBICIDES**

These are ratings for burndown materials alone, and also for some of the more widely used combinations in corn, cotton or soybeans. See appropriate crop section in this manual for the specific labeled and recommended burndown and residual herbicides.

* Herbicide mode of action see page 83 for details.

*a* Poor performance is possible with this product if day time temperatures are less than 60 F.

</tbody>
</table>

Good to excellent control of annual grasses, nutsedge and seedling johnsongrass. Apply alone or in combination with other layby materials. May be purchased as a packaged mix with glyphosate as Sequence.

Outlook may be applied post emergence to cotton for residual weed control from first true leaf stage to the mid-bloom stage.

Apply MSMA as a directed spray when cotton is at least 3” tall. Follow label directions regarding addition of surfactant. MSMA may be tank-mixed with most herbicides labeled for post-directed use in cotton. **Do not apply after first bloom.**

Apply as a directed spray when cotton is at least 6” tall. If omitting MSMA, be sure to add surfactant (1 qts./100 gals. of spray mix). Caparol can be applied, at a reduced rate, to 3 to 6” cotton. See label.

May be applied to cotton at least 6 inches tall until bloom. Precise application is necessary to avoid cotton injury.

May be applied after cotton reaches 12 inches tall until bloom. May injure fall-seeded cover crops.

*(u) - Restricted Use Herbicide*
**GLYPHOSATE-RESISTANT PALMER AMARANTH MANAGEMENT SYSTEMS**

Control of Palmer amaranth will center on PRE applied herbicides. This is particularly the case for Palmer amaranth that is PPO and glyphosate resistant. Liberty, Engenia, XtendiMax or Enlist One are very effective.

CORN WEED CONTROL

Atrazine and Water Quality

Atrazine label restrictions regarding mixing, loading and application are discussed below. These restrictions are part of the overall ground and surface water contamination risk reduction measures. Atrazine users are strongly encouraged to follow these guidelines to comply with the label, and to share in the responsibility of preserving the future of this extremely valuable corn herbicide. These restrictions, and the Restricted Use Pesticide designation, apply to all formulations of atrazine, and all package mix products which contain atrazine.

Mixing, Loading and Application — Atrazine may not be mixed/loaded or used within 50 feet of all wells, including abandoned wells, drainage wells and sink holes. Atrazine may not be mixed or loaded within 50 feet of intermittent streams and rivers, natural or impounded lakes and reservoirs. Atrazine may not be applied aerially or by ground within 66 feet of the points where field surface runoff enters perennial or intermittent streams and rivers or within 200 feet around natural or impounded lakes and reservoirs. If atrazine is applied to highly erodible land, the 66-foot buffer or setback from runoff entry points must be planted to corn, seeded with grass, or another suitable crop.

Postemergence Applications

If no atrazine was applied prior to corn emergence, apply a maximum of 2 lbs. a.i./acre. If a postemergence treatment is required following an earlier herbicide application, the total atrazine applied may not exceed 2.5 lbs. a.i./acre/calendar year. Postemergence applications to corn must be made before corn exceeds 12 inches in height.

BURNDOWN HERBICIDES RECOMMENDED FOR NO-TILL CORN*

<td></td>
<td></td>
</tr>
</tbody>
</table>
**CORN HARVEST AIDS**

Harvest aid products are sometimes needed to desiccate weeds in order to improve timeliness of harvest. This is most frequently encountered with early maturing hybrids which may be ready for harvest prior to a killing frost. Harvest aid chemicals do not speed-up maturity of the corn plant; they merely reduce moisture in weeds and may improve harvest efficiency, in addition to timeliness. Producers are encouraged to make harvest aid decisions by comparing cost with anticipated benefits. Also, care must be taken to minimize chances of drift to adjacent crops. Be sure to read labels thoroughly and follow required preharvest intervals (PHI).

<table>
<thead>

**KEY TO RESPONSE RATINGS:** 0 = No control, 10 = 100% control; ---- = Data not available  
Ratings are based on application of labeled rates of each herbicide, applied at the optimum timing for each weed.  
(U) Restricted Use Pesticide
GRAIN SORGHUM WEED CONTROL

Introduction
Weeds can exert serious pressure on young grain sorghum through competition for water, nutrients and light. If allowed to compete through mid- to late-season, many weeds can grow taller than grain sorghum and reduce yield, delay maturity and hinder harvesting. In most fields, a season-long weed control program is needed for successful grain sorghum production.

Grain Sorghum and Johnsongrass
Do not plant grain sorghum in fields that are heavily infested with johnsongrass. Johnsongrass is a very vigorous competitor for water, nutrients and light. The weed is closely related to grain sorghum, and it harbors several diseases and insects which attack grain sorghum. No herbicides are available to adequately control johnsongrass in grain sorghum.

Atrazine and Water Quality
Atrazine label restrictions regarding mixing, loading and application are discussed below. These restrictions are part of the overall ground and surface water contamination risk reduction measures. Atrazine users are strongly encouraged to follow these guidelines to comply with the label, and to share in the responsibility of preserving the future of this extremely valuable grain sorghum herbicide. These restrictions, and the Restricted Use Pesticide designation, apply to all formulations of atrazine, and all package mix products which contain atrazine.

Mixing, Loading and Application — Atrazine may not be mixed/loaded or used within 50 feet of all wells, including abandoned wells, drainage wells and sink holes. Atrazine may not be mixed or loaded within 50 feet of intermittent streams and rivers, natural or impounded lakes and reservoirs. Atrazine may not be applied aerially or by ground within 66 feet of the points where field surface runoff enters perennial or intermittent streams and rivers or within 200 feet around natural or impounded lakes and reservoirs. If atrazine is applied to highly erodible land, the 66-foot buffer of setback from runoff entry points must be planted to grain sorghum, seeded with grass, or another suitable crop.

Application rates - All soil applications prior to crop emergence —
* Highly Erodible Soils (as defined by NRCS) — If conservation tillage is practiced (at least 30 percent residue coverage at planting), apply a maximum of 2 lbs. a.i./acre. If residue coverage is less than 30 percent, apply a maximum of 1.6 lbs. a.i./acre.
* Soils Not Highly Erodible — Apply a maximum of 2 lbs. a.i./acre.

WARNING: These are the rates as listed on the AAtrex label, and they exceed the amount of atrazine recommended preemergence (in Bicep II Magnum, Bullet or Lariat) on grain sorghum by the University of Tennessee. Grain sorghum, and particularly no-till grain sorghum, may be injured by preemergence applications of atrazine. To reduce chances of injury, atrazine applications should be delayed until the crop has emerged.

Postemergence applications
If no atrazine was applied prior to grain sorghum emergence, apply a maximum of 2 lbs. a.i./acre. If a postemergence treatment is required following an earlier herbicide application, the total atrazine applied may not exceed 2.5 lbs. a.i./acre/calendar year. Postemergence applications to grain sorghum must be made before grain sorghum exceeds 12 inches in height.
### BURNDOWN HERBICIDES RECOMMENDED FOR NO-TILL GRAIN SORGHUM*

Sandy loam: do not use  
Silt loam: 1.3-2.1 qts.  
Silty clay loam: 1.3-2.1 qts. | Use 1.3-2 qts./A on soil with OM less than 1%. Controls most annual grasses and many broadleaf weeds. **Do not use unless your seed has been treated with Concep seed safener.** |
| **S-metolachlor** | Sandy loam: 0.96-1.27 lb  
Silt loam: 1.27-1.43 lb  
Silty clay loam: 1.27-1.6 lb | **Dual II Magnum**  
Sandy loam: 1.0-1.33 pts.  
Silt loam: 1.33-1.5 pts.  
Silty clay loam: 1.33-1.67 pts. | Recommended on overflow areas or fields where variable soil textures prevent preemergence application of atrazine. Will control most annual grasses and some broadleaf weeds. **Use only with Concep or Screen safened seed.** Use postemergence herbicides for broadleaf weed control. |
| **S-metolachlor + glyphosate + mesotrione** | 2.0-2.2 lb  
15+9+27 | **Halex GT** 3.6-4 pts/A | Can be used Pre plant or Pre emergence. |
| **S-metolachlor + mesotrione + atrazine (u)** | 2.78 lb  
15+27+5 | **Lexar EZ (u)** 3.0 qts. | Cannot be used on coarse textured soils. Applying Lexar EZ less than 7 days before sorghum planting will increase the risk of crop injury, especially if irrigation or rainfall is received following the application. Applying Lexar EZ more than 7 days (but not more than 21) prior to sorghum planting will reduce the risk of crop injury. **Use only with Concep safened seed.** |
| **dimethenamid** | 0.56-0.75 lb  
15 | **Outlook**  
12 to 16 ozs | Can be used Pre plant or Pre emergence. |
| **saflufenacil** | 0.067 lb  
14 | **Sharpen SG** 3 ozs. | Before applying Sharpen to sorghum, verify with your local seed company the selectivity of Sharpen on your hybrid to help avoid potential injury. |
| **saflufenacil + dimethenamid-P (14+15)** | 0.218 – 0.436 lb  
14 +15 | **Verdict 5.57 EC**  
5-10 ozs | Apply preplant or pre to grain sorghum that has been treated with an approved chloroacetamide seed safener such as Concep III. Tank mix with glyphosate or paraquat for best burndown results. |
| **acetochlor** | 1.10 – 1.65 lb  
15 | **Warrant 1.5 – 2.25 qts** | Apply only to sorghum planted with seed that has been properly treated with seed protectant or safener. |

*NOTE: Postemergence treatments may be required to control cocklebur, sicklepod or other hard-to-control broadleaf weeds.

(u) **Restricted Use Pesticide**--Refer to label for precautions to be taken during handling and application.

GRAIN SORGHUM HARVEST AIDS

Harvest aid products are sometimes needed to desiccate weeds in order to improve timeliness of harvest. This is most frequently encountered with early maturing varieties which may be ready for harvest prior to a killing frost. Harvest aid products do not speed up maturity of the grain sorghum plant; they merely reduce moisture in weeds and may improve harvest efficiency, in addition to timeliness. Be sure to read labels thoroughly and follow required preharvest intervals (PHI).

COTTON WEED CONTROL

NO-TILL COTTON WEED CONTROL CONSIDERATIONS

Weed management systems for cotton should prevent weed interference, be economical and sustainable, reduce weed seed bank in soil, prevent weed resistance and neither injure cotton nor reduce quality, lint or seed yield. To be successful, weed management systems require advance planning and timely execution. A few days delay in an application may mean reduced control, higher herbicide rates, and greater herbicide costs.

The components of a weed management system for no-tillage cotton may include the following:

1. Early preplant burndown with or without residual herbicide(s)
2. At-planting burndown with or without residual herbicide(s)
3. Postemergence with or without residual herbicide(s)
4. Post-directed herbicide(s) with or without residual herbicide(s)
5. Layby herbicide(s)
6. Pre-harvest herbicide(s)

Our most consistent and effective early preplant burndown program has included glyphosate plus Clarity, especially where glyphosate-resistant (GR) horseweed is present. Valor can be added to extend the preemergence control, but cost is increased. Where this program has been followed by an at-planting burndown of Gramoxone SL or Liberty 280 SL with a residual herbicide (Cotoran, Direx, Caparol, etc), excellent control has been achieved. Prowl can also be included with the at-planting application for additional control at little extra cost.

Timely postemergence application of glyphosate alone or tank-mixed with Dual Magnum (available as package mixture trade named Sequence) to improve grass and nutsedge control or Staple to improve morningglory control are critical to prevent early weed competition and establish a height differential for subsequent post-directed or hooded sprayer application. Envoke can be applied postemergence overtop after cotton reaches 5-true leaves for improved morningglory control. Envoke does not control Palmer amaranth (pigweed).

Post-directed application of herbicides can be made to cotton once a height differential between cotton and weeds is achieved. Cotoran plus MSMA may be post-directed in cotton at least 3 inches tall and will provide contact and residual control of many weed species. After cotton reaches 6 inches, Caparol, Direx, Layby Pro, Goal, Suprend and Cobra may be used. Any of these products can be applied with glyphosate in RR cotton but spray must be directed to the base of the cotton plant. Expect some glyphosate antagonism, especially on grasses, with some tank mixtures. Aim, Gramoxone SL, Liberty 280 SL, and Glyphosate may be used under hooded sprayers in any cotton varieties.

Layby herbicides for cotton include Caparol, Cotoran, Direx, Layby Pro, Suprend and Valor. Layby applications differ from normal post-directed applications in that cotton should be >12 inches tall and generally higher application rates are used.
## Preplant Herbicides for Burndown and Residual Weed Control — Cotton

<table>
<thead>
<tr>
<th>Herbicide(site of action)</th>
<th>Rate/Acre Broadcast</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>fluridone</td>
<td>0.15 lb. - 0.3 lb</td>
<td>Brake 1 pt.</td>
<td>Corn and sorghum rotation restriction is 10 months and soybean is 4 months.</td>
</tr>
<tr>
<td>trifloxsulfuron</td>
<td>0.005 lb</td>
<td>Envoke 0.10 ozs.</td>
<td>Use after November 15 and treated fields MUST be planted back to cotton. Safe on wheat cover crop. Some plant residue should remain on the field to reduce soil erosion on highly erodible soils. Tank mix with 2,4-D or dicamba to increase weed spectrum on winter annuals.</td>
</tr>
<tr>
<td>dicamba + glyphosate</td>
<td>0.25 lb. + 0.75 - 1.5 lb (a.e)</td>
<td>Clarity + Roundup PowerMax 8 ozs. + 22 - 43 ozs.</td>
<td>Preplant for control of emerged annual weeds prior to planting cotton. Best results are obtained when weeds are small and actively growing and during warm weather. A minimum of 1 inch of rainfall/irrigation and a 15 day waiting period after rainfall/irrigation is required per 8 ounces applied, before planting cotton. No waiting period for Xtend varieties with approved dicamba formulations. May be tank-mixed with Caparol, Cotoran, or Gramoxone SL for control of additional grasses and broadleaf weeds.</td>
</tr>
<tr>
<td>2,4-D + glyphosate</td>
<td>0.5 - 1.0 lb. + 0.75 - 1.5 lb (a.e.)</td>
<td>2,4-D + Roundup PowerMax 1.0-2.0 pt. of a 4 lb /gal. formulation + 22 - 43 ozs.</td>
<td>Apply 2,4-D before cotton planting for control of existing horseweed. With 2,4-D apply 30 days prior to cotton planting. Do not use 2,4-D on light, sandy soils. No waiting period for Enlist varieties for Enlist Duo applications. Higher 2,4-D rates (1.5 to 2 pts/A) have provided consistently better control of glyphosate-resistant horseweed.</td>
</tr>
<tr>
<td>flumioxazin + burndown herbicide</td>
<td>0.5 - 1 oz</td>
<td>Valor 51% WDG 1 - 2 ozs.</td>
<td>Use after November 15 in combination with labeled burndown herbicides to control emerged weeds and provide residual control of horseweed up to cotton planting. DO NOT apply to soils prone to erosion unless adequate crop residue is present to reduce erosion. A minimum of 30 days must pass, and 1 inch of rainfall/irrigation must occur, between Valor application and planting of cotton. Valor will not control existing horseweed.</td>
</tr>

</tr>
<tr>
<td>glyphosate (9)</td>
<td>0.75-1.1 lb (a.e.)</td>
<td>Roundup PowerMax*</td>
<td>22-32 ozs.</td>
<td>Apply 2 to 4 weeks prior to your anticipated planting date to control non-resistant horseweed (marestail) and several other weeds. In most fields, a follow-up application of Gramoxone SL will be needed at planting.</td>
</tr>
</tbody>
</table>

\(^a\)- Restricted Use Herbicide

* NOTE: Several brands of glyphosate have become available in recent years. Products differ in terms of concentration, rates, addition of surfactant and registration on Roundup Ready crops. Always read the label before application.
### PREEMERGENCE HERBICIDES FOR CONVENTIONAL OR NO-TILL COTTON

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Rate/Acre Broadcast</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluridone + fluometuron (12+7)</td>
<td>0.15 lb.</td>
<td>Brake + Cotoran 1 pt. + 24 ozs.</td>
<td>This herbicide provides good residual Palmer control on sand and siltloam soils. Avoid use on clay soils. It needs a good rain or irrigation to become activated. As such, most consistent residual control is tankmixed with another product that is more water soluble like Cotoran. Also sold as a premix with Cotoran (Brake FX).</td>
</tr>
<tr>
<td>prometryn (5)</td>
<td>0.75-1.25 lb&lt;sup&gt;a&lt;/sup&gt;</td>
<td>Caparol 4L 1.5-2.5 pts.&lt;sup&gt;a&lt;/sup&gt;</td>
<td>Good to excellent control of most annual grasses and broadleaf weeds, particularly residual pigweed control.</td>
</tr>
<tr>
<td>clomazone (13)</td>
<td>0.75 lb</td>
<td>Command 3ME 32 ozs.</td>
<td>For use where junglerice, barnyardgrass, goosegrass and sida species are problematic. Many trees, bushes, ornamentals and vegetables are sensitive to drift of this herbicide. See label for drift reduction directions and restrictions. <strong>Note: Thimet insecticide must be used in-furrow or severe crop injury may occur.</strong></td>
</tr>
<tr>
<td>fluometuron (7)</td>
<td>1.0 lb&lt;sup&gt;a&lt;/sup&gt;</td>
<td>Cotoran 4L or 85DF 2 pts. 4L, or 1.2 lbs. 85DF, or 1.25 lbs. 80DF&lt;sup&gt;b&lt;/sup&gt;</td>
<td>Good to excellent control of most annual grasses and broadleaf weeds. For improved pigweed control, particularly in no-till, reduced rates of Caparol may be applied in combination with Cotoran preemergence. See label for precautions. Rates in pints/A are based on soil texture: Staple may be added to Cotoran or Meturon preemergence for improved control of pigweed, prickly sida, spotted spurge, spurred anoda and velvetleaf. Add 0.6 oz./A to your normal rate of Cotoran. A follow-up postemergence application of 1.2 oz. can be made for control of cocklebur, morningglory and other escapes. See label.</td>
</tr>
<tr>
<td>fluometuron + prometryn (7+5)</td>
<td>0.5 lb + 0.5 lb</td>
<td>Cotoran 4L + Caparol 4L 16 ozs. + 16 ozs.</td>
<td>Adjust rates to labeled soil texture requirements.</td>
</tr>
<tr>
<td>fluometuron + pendimethalin (7+3)</td>
<td>1.0 lb + 0.75 lb</td>
<td>Cotoran 4L + Prowl H2O 32 ozs. + 26 ozs.</td>
<td>Provides two modes of action to control Palmer amaranth and provide barnyardgrass/junglrice and goosegrass control.</td>
</tr>
<tr>
<td>pendimethalin (3)</td>
<td>0.5-0.75 lb&lt;sup&gt;a&lt;/sup&gt;</td>

## OVERTOP HERBICIDES FOR COTTON

<table>
<thead>
<tr>
<th>Herbicide(site of action)</th>
<th>Rate/Acre Broadcast</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>2,4-D (4) Enlist Cotton Only</td>
<td>0.71-0.95 lb</td>
<td>Enlist One 1.5-2.0 pts.</td>
<td>Do not apply if sensitive crops or plants are down wind. Also, labels must be followed with great attention to detail. Spraying near twilight or at night, wrong nozzles, off-label wind speed, excessive boom height, the addition of AMS to spray mixture, etc. could increase chances for off target movement. Can also be purchased as premix with glyphosate (Enlist Duo). Refer to the label or websites for more information.</td>
</tr>
<tr>
<td>quizalofop (1)</td>
<td>0.034-0.069 lb</td>
<td>Assure II 0.88E 5-10 ozs.</td>
<td>Apply overtop to control rhizome johnsongrass. Apply 5 ozs. of Assure II when johnsongrass is 10-24&quot; tall and retreat with 5 ozs. when grass regrowth reaches 6-10&quot; tall. Add oil concentrate at 1 gal. (for ground application) or 1 qt. nonionic surfactant per 100 gals. of spray mixture. The higher rates may be needed to control annual grasses or bermudagrass. See label.</td>
</tr>
<tr>
<td>dicamba (4) Xtend Cotton Only</td>
<td>0.5 lb</td>
<td>Engenia 12.8 ozs. XtendiMax 22 ozs. FeXaPan 22 ozs. Tavium 56.5 ozs</td>
<td>Applicators must take dicamba-specific training and be a certified applicator. The federal labeled cutoff for dicamba applications in Xtend cotton is 60 days after planting. In addition to label requirements the following best management practices are recommended to minimize off-target movement. UT research suggests that dicamba-based herbicides are more prone to off-target movement as temperature increases. Therefore best management practices to minimize drift are to only apply if the expected high air temperature of the day is less than 85°F or before June 15 whichever is more restrictive. UT research also indicates that tankmixing glyphosate with these low-volatile dicamba formulations will lower the solution pH which can result in increased dicamba emissions. Despite many applicators’ best efforts with applications, drift has apparently occurred with these products in multiple directions from treated fields independent of wind direction. Do not apply if sensitive crops or plants are in adjacent fields. Also, labels must be followed with great attention to detail. Spraying at night, wrong nozzles, off-label wind speed, excessive boom height, the addition of AMS to spray mixture, etc. could increase chances for off-target movement. Tavium a premix of XtendiMax and Dual Magnum has a more restrictive label than XtendiMax. Refer to the label or websites for more restrictions and information.</td>
</tr>
<tr>
<td>S-metolachlor (15)</td>
<td>0.96-1.27 lbs</td>
<td>Dual Magnum 1.0-1.33 pts.</td>
<td>100 day PHI when applied. Application in environmentally stressful conditions can increase crop injury.</td>
</tr>
<tr>
<td>trifloxysulfuron (2)</td>
<td>0.0046-0.0069 lb</td>
<td>Envoke 75DF 0.1-0.15 ozs.</td>
<td>Apply overtop of 5 leaf until 60 day PHI cotton for control of smooth pigweed, morningglories, and yellow nutsedge. Poor performance on Palmer pigweed. Apply with non-ionic surfactant (80-20 blend, NOT with 90-10 blend) at the rate of 1 quart per 100 gallons of water. DO NOT use with crop oil concentrate or tank-mix with Pix growth regulator or other pesticides. NEVER apply preemergence as substantial cotton injury will result.</td>

</tr>
<tr>
<td>clethodim</td>
<td>0.12-0.25 lb.</td>
<td>Select Max 1 EC 16-32 ozs.</td>
<td>Do not tank mix with dicamba to improve overall grass control. Always use crop oil concentrate at 1 pt./A. Should be used in fields where glyphosate has failed to control barnyardgrass, junglerice and goosegrass. Clethodim not as effective on Johnsongrass as Assure or Fusilade.</td>
</tr>
<tr>
<td>glyphosate + S-metolachlor</td>
<td>0.75 ae + 0.94 ai lb</td>
<td>Sequence 5.25L 2.5 pints</td>
<td>Apply to cotton at least 3 inches tall but before cotton reaches fifth leaf stage. Do not add adjutants and do not add other pesticides. Applied in environmentally stressful conditions can increase crop injury.</td>
</tr>
<tr>
<td>pyrithiobac</td>
<td>0.043-0.095 lb</td>
<td>Staple LX 1.7-3.8 ozs.</td>
<td>Apply overtop or post-directed beginning at the first true leaf stage of cotton. Poor performance on Palmer pigweed. Add nonionic surfactant (1 qt./100 gal. of spray mix). A total of 5.1 oz./A may be applied per season. Do not tank-mix with malathion-containing insecticides (Cythion, etc.). To avoid injury, malathion should be applied at least 24 hrs. before or after Staple application. May be tank-mixed with glyphosate. See label.</td>
</tr>
</tbody>
</table>

*NOTE: Several brands of glyphosate have become available in recent years. Products differ in terms of concentration, rates, addition of surfactant and registration on Roundup Ready crops. Always read the label before application.*
**POST-DIRECTED HERBICIDES RECOMMENDED FOR COTTON**

Recommended post-directed herbicides are listed in the following table. Each is usually applied in combination with MSMA for improved grass and nutsedge control. Various formulations of MSMA are available - some with a built-in surfactant and some without it. The 6 lb/gal formulation used as an example below usually contains surfactant. Rates are expressed on a broadcast basis. Use the conversion table, later in this section, to determine band rates.

</table>
Factors to convert Broadcast Rate/A to a Band Rate at Various Row and Band Widths.

<table>
<thead>
<tr>
<th>Band Width (in.)</th>
<th>30</th>
<th>36</th>
<th>38</th>
<th>40</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>0.40</td>
<td>0.33</td>
<td>0.31</td>
<td>0.30</td>
</tr>
<tr>
<td>15</td>
<td>0.50</td>
<td>0.42</td>
<td>0.39</td>
<td>0.375</td>
</tr>
<tr>
<td>18</td>
<td>0.60</td>
<td>0.50</td>
<td>0.47</td>
<td>0.45</td>
</tr>
<tr>
<td>19</td>
<td>0.635</td>
<td>0.53</td>
<td>0.50</td>
<td>0.475</td>
</tr>
<tr>
<td>20</td>
<td>0.67</td>
<td>0.56</td>
<td>0.53</td>
<td>0.50</td>
</tr>
</tbody>
</table>

To Convert: Find the factor for your combination of row width and band width and multiply the broadcast rate by this number.

Example: A producer plans to apply 0.5 lb. (broadcast rate) per acre of Direx 80 DF on a 12 in. band on 38 in. rows. Multiply 0.31 by 0.5 lb. to get 0.16 lb./A on a 12 in. band.

Hooded Sprayers

HERBICIDES RECOMMENDED FOR USE IN HOODED SPRAYERS

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Active Ingredient</th>
<th>Formulated Product</th>
<th>Rate/Acre Broadcast*</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>paraquat (u)</td>
<td>0.31-0.62 lb</td>
<td>Gramoxone SL (u)</td>
<td>20-40 ozs.</td>
<td>State label for Tennessee. <strong>Apply in cotton at least 6” tall using hooded sprayers only. Avoid crop contact.</strong> Always add nonionic surfactant (1 qt./100gals.of spray mix). Operate hoods as close to soil surface as possible. Gramoxone SL is labeled for tank-mix applications with residual herbicides (Cotoran, Caparol, Direx). See labels for rates and precautions.</td>
</tr>
<tr>
<td>glyphosate</td>
<td>0.75-1.1 lb (a.e.)</td>
<td>Roundup PowerMax 4.5</td>
<td>32 ozs.</td>
<td></td>
</tr>
<tr>
<td>fomesafen</td>
<td>0.25-0.375 lb</td>
<td>Reflex 1-1.5 pts.</td>
<td></td>
<td>Use only hooded or shielded spray equipment to apply Reflex in cotton that is 6” to 12” in height. Adjust nozzles to provide full coverage of emerged target weeds. Crop rotation is restricted to 4 months for wheat and 10 months for corn.</td>
</tr>
<tr>
<td>flumioxazin</td>
<td>0.5 - 1 oz</td>
<td>Valor 51% SX</td>
<td>1 - 2 ozs.</td>
<td>Operate hoods as close to soil surface as possible. Provides good control of morningglories and pigweeds. Glyphosate may be added to control existing vegetation.</td>
</tr>
</tbody>
</table>

(u) - Restricted Use Herbicide
LAYBY HERBICIDES RECOMMENDED FOR COTTON

Producers should consider the use of layby herbicides to improve both yield and quality of cotton lint. Good layby programs can reduce lint stain and trash, improve grades, and increase picking speed and efficiency. Each of the following herbicides can be tank mixed with MSMA to improve postemergence grass and nutseed control. **Do not apply MSMA, alone or in combination with other herbicides, after first bloom.**

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Rate/Acre Broadcast*</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>prometryn (5)</td>
<td>1.2-1.6 lb</td>
<td>Caparol 4L</td>
<td>Apply when cotton is at least 12” tall and before it laps the row middles. Rate depends on soil texture. (Apply 2.8 pts. on a silt loam soil). Add nonionic surfactant (2 qts./100 gals. of spray mix) if weeds are present.</td>
</tr>
<tr>
<td>fluometuron (7)</td>
<td>1-2 lb</td>
<td>Cotoran 4L</td>
<td>Apply before cotton laps the row middles. Add nonionic surfactant (1-2 qts./100 gals. of spray mix) if weeds are present. Do not make more than 3 applications of fluometuron to the same field per year. Do not apply within 60 days of harvest.</td>
</tr>
<tr>
<td>diuron (7)</td>
<td>0.8-1.2 lb</td>
<td>Direx 4L</td>
<td>Apply when cotton is at least 12” tall and before it laps the row middles. Add nonionic surfactant (1 qt./100 gals. of spray mix) if weeds are present. Reduced rates (1-1.5 pt. 4L or 0.63-0.94 lb. 80DF) may be tank mixed with Roundup PowerMax at 22 oz./A.</td>
</tr>
<tr>
<td>linuron (7)</td>
<td>1-1.5 lb</td>
<td>Linex 4L</td>
<td>Apply after cotton is 20” tall. If weeds are present, add a nonionic surfactant at the rate of 2 qt. per 100 gal. of spray mix.</td>
</tr>
<tr>

## SOYBEAN WEED CONTROL

### BURNDOWN HERBICIDES FOR NO-TILL SOYBEAN

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Rate/Acre Broadcast</th>
<th>Active Ingredient</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>halauxifen-methyl</td>
<td>0.004 lb Broadcast</td>
<td>Elevore 1 oz</td>
<td>Apply prior to 8” tall horseweed for most consistent control. Add 1% MSO for best results.</td>
<td></td>
</tr>
<tr>
<td>paraquat (u)</td>
<td>0.5 - 0.75 lb</td>
<td>Gramoxone SL(u) 32 - 48 ozs.</td>
<td>Apply in a minimum of 10 gallons of water per acre. Weeds taller than 6” may not be controlled adequately. As density of stubble, crop residue or weeds increases, water volume should be increased to ensure good coverage. Add a nonionic surfactant (at least 75% active) at 1 pt. per 100 gallons of mix. For aerial applications, apply at 5-10 gallons of water per acre.</td>
<td></td>
</tr>
<tr>
<td>rimsulfuron + thifensulfuron-methyl (2 +2)</td>
<td>0.0313 – 0.0564 lb</td>
<td>Crusher/Leadoff 1.0 oz./1.5 - 2.7 ozs.</td>
<td>Applied 30 days or more preplant to cotton or soybean for winter vegetation management. Crop injury may occur if there is a prolonged period of cold weather and/or in conjunction with wet soils. Apply with 1% COC or 0.5% MSO or 0.25% NIS.</td>
<td></td>
</tr>
<tr>
<td>glufosinate</td>
<td>0.4 – 0.53 lb</td>
<td>Liberty 280 SL 22 – 29 ozs. Up to 36 ozs.</td>
<td>Thorough spray coverage is essential for optimal performance. Will control Palmer up to 4 to 6” tall. A follow up application of Ignite 7 to 10 days after the first application may be needed to control regrowth of Palmer that is over 5” tall. Ground application requires a minimum of 15 gallons of water/acre. Dense weed canopies require 20 to 40 gallons per acre. See label for further application instructions and tank-mix partners. If 36 oz is used at burndown, only 29 oz can be used POST.</td>
<td></td>
</tr>
<tr>
<td>clethodim</td>
<td>0.12 – .25 lb</td>
<td>Select 2EC 16 - 32 oz</td>
<td>Always use a crop oil concentrate at listed rate (but not less than 1 pt/A)</td>
<td></td>
</tr>
<tr>
<td>saflufenacil</td>
<td>0.02 lb</td>
<td>Sharpen SG 1 ozs.</td>
<td>30 day plant back restriction to soybean on coarse soils with O.M. less than 2. Tank-mix with glyphosate or Gramoxone SL for best burndown results. 1.0% MSO. Do not tank-mix with Valor.</td>
<td></td>
</tr>
<tr>
<td>glyphosate (9)</td>
<td>1.1 – 1.5 lb (a.e.)</td>
<td>Roundup PowerMax 4.5ae 32 – 44 ozs.</td>
<td>Apply in 10-20 gallons of water per acre. More effective than Gramoxone SL on weeds such as smartweed and fall panicum. Apply lower rates to control many annual weeds less than 6” tall. Increase the rate on barnyardgrass species, larger annual weeds and perennials. (See label).</td>
<td></td>
</tr>
<tr>
<td>saflufenacil + dimethenmid</td>
<td>0.22 – 0.435 lb</td>
<td>Verdict 5 – 10 oz</td>
<td>Minimum preplant interval of 30 days is required for coarse (sand, loamy sand, and sandy loam) soils with ≤ 2.0% organic matter. Tank-mix with glyphosate or Gramoxone SL for best burndown results. 1.0% MSO. Do not tank-mix with Valor. Verdict contains product that will give some residual control of grasses.</td>
<td></td>
</tr>
</tbody>
</table>

(u)--Restricted Use Herbicide.

* NOTE: Several brands of glyphosate have become available in recent years. Products differ in terms of concentration, rates, addition of surfactant and registration on Roundup Ready crops. Always read the label before application.
**PREPLANT INCORPORATED HERBICIDES FOR SOYBEAN**

<table>
<thead>
<tr>
<th>Herbicide(site of action)</th>
<th>Active Ingredient</th>
<th>Formulated Product</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>trifluralin (3)</td>
<td>sandy loam: 0.5 lb silt loam: 0.75 lb silty clay loam: 1.0 lb</td>
<td>Treflan 1 pt. 1.5 pts. 2.0 pts.</td>
<td>For best results, incorporate <strong>immediately</strong> after application. Trifluralin is labeled for incorporation* into the top 2-3” of soil. The 2X or double the normal rate of trifluralin can be applied for increased suppression of rhizome johnsongrass. However, this must be followed by 2 or more timely cultivations. <strong>Use a recommended preemergence herbicide for broadleaf control.</strong></td>
</tr>
</tbody>
</table>

*For proper incorporation, a disk should be set to cut about twice as deep as placement is desired. A second mixing with shallow discing or field cultivator usually improves weed control. See label for incorporation instructions with other implements.

</tbody>
</table>
Postemergence Weed Control in Soybean: Postemergence herbicides work best under the following conditions: weeds are young and rapidly growing, high humidity and good soil moisture, and good spray coverage. Performance is reduced when weeds are stressed due to drought, disease or cultivation, or when weeds are too large. Select the most effective weed management program for the money you can afford to spend. The following tables should assist with selection of a program for controlling your weeds.

### POSTEMERGENCE HERBICIDES FOR WEED CONTROL IN SOYBEAN

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Active Ingredient</th>
<th>Formulated Product</th>
<th>Remarks**</th>
</tr>
</thead>
<tbody>
<tr>
<td>carfentrazone (14)</td>
<td>0.008-0.025 lb.</td>
<td>Aim 0.25-0.5 ozs.</td>
<td>Apply overtop of soybean from V3 to V10 to control velvetleaf and morningglories. Causes soybean foliar burn which is usually of short duration. Always add 1 qt. nonionic surfactant per 100 gals. of spray mix. May be tank-mixed with glyphosate to control larger morningglories.</td>
</tr>
<tr>
<td>pyroxasulfone + fluthiacet-methyl (14,15)</td>
<td>0.084-0.0151 lbs.</td>
<td>Anthem Maxx 2.5-4.5 ozs.</td>
<td>Do not graze or feed treated soybean forage/hay to livestock. The last application for soybean should be made no later than 60 days before harvest.</td>
</tr>
<tr>
<td>quizalofop (1)</td>
<td>0.034-0.069 lb.</td>
<td>Assure II 0.88E 5-10 ozs.</td>
<td>Apply overtop to control rhizome johnsongrass. Apply 5 ozs. of Assure II when johnsongrass is 10-24&quot; tall and re-treat with 5 ozs. when grass regrowth reaches 6-10&quot; tall. Add oil concentrate at 1 gal. (for ground application) or 1 qt. nonionic surfactant per 100 gals. of spray mixture. The higher rates may be needed to control annual grasses or bermudagrass. See label. Controls volunteer Roundup Ready corn in soybean.</td>
</tr>
<tr>
<td>bentazon (6)</td>
<td>0.75-1.0 lb.</td>
<td>Basagran 4SC 1.5-2 pts.</td>
<td>Apply to control cocklebur, prickly sida and other broadleaf weeds. Addition of 1 qt./A of crop oil concentrate may improve control of ragweed and lambsquarters. Add 2 ozs. of 2,4-DB (Butyrac) to the regular rate of Basagran for improved control of morningglory. Do not add oil or surfactant when mixing with 2,4-DB.</td>
</tr>
<tr>
<td>chlorimuron (2)</td>
<td>0.008-0.012 lb.</td>
<td>Classic 25DF 0.5-0.75 oz.</td>
<td>Apply to control cocklebur, pigweed, burcucumber and other broadleaf weeds. Can be applied after the first trifoliate until 60 days before harvest. Weak on prickly sida and lambsquarters. Add 1 qt. of nonionic surfactant (80 percent active) per 100 gal. spray mix. See label for information concerning the use of crop oil concentrate and liquid fertilizer. Classic may be tank-mixed with glyphosate (Roundup Ready soybeans only) for improved control of morningglory and hemp sesbania (see label). Do not plant corn, cotton, or sorghum within 9 months after application. See label for other crops. For salvage control of cocklebur or smooth pigweed, apply .75 oz. and 1 qt. of crop oil concentrate.</td>
</tr>
<tr>
<td>Herbicide (site of action)</td>

<td>Formulated Product</td>
<td>Remarks**</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------</td>
<td>--------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>dicamba (4) Xtend Soybean Only</td>
<td>0.5 lb dicamba (4)</td>
<td><strong>Engenia 12.8 ozs.</strong></td>
<td>Applicators must take dicamba-specific training and be a certified applicator. In addition to label requirements, the following best management practices are recommended by UT to minimize off-target movement. UT research suggests that dicamba-based herbicides are more prone to off-target movement as temperature increases. <strong>Best management practices to minimize drift are to only apply if the expected high air temperature of the day is less than 85 F or before June 15 whichever is more restrictive.</strong> UT research also suggests that tankmixing glyphosate with these low-volatile dicamba formulations will lower the solution pH which can result in increased dicamba emissions. Despite many applicators’ best efforts with applications, drift has apparently occurred with these products in multiple directions from treated fields independent of wind direction. Do not apply if sensitive crops or plants are in adjacent fields. Also, labels must be followed with great attention to detail. Spraying at night, wrong nozzles, off-label wind speed, excessive boom height, the addition of AMS to spray mixture, etc. could increase chances for off-target movement. The current labeled cutoff for dicamba applications in Xtend soybean is R1 or 45 days after planting. Tavium a premix of XtendiMax and Dual Magnum has a more restrictive label than XtendiMax. Refer to the label or websites for more restrictions and information. Tankmixes with these three herbicides may antagonize glyphosate and/or clethodim grass control.</td>
</tr>
</tbody>
</table>

| 2,4-D (4) Enlist Soybean Only | 0.71-0.95 lb 2,4-D (4) | **Enlist One 1.5-2.0 pts.** | Do not apply if sensitive crops or plants are down wind. Also, labels must be followed with great attention to detail. Spraying near twilight or at night, wrong nozzles, off-label wind speed, excessive boom height, the addition of AMS to spray mixture, etc. could increase chances for off target movement. Can also be purchased as premix with glyphosate (Enlist Duo). Refer to the label or websites for more information. |

| lactofen (14) | 0.2 lb. lactofen (14) | **Cobra 2E 12.5 ozs.** | Apply to control morningglory, balloonvine and several broadleaf weeds. Add 2 pts. nonionic surfactant, or 2 to 4 pts. crop oil concentrate, per 100 gals. spray. Causes soybean foliar burn which is usually of short duration. |

| cloransulam-methyl (2) | 0.016-0.032 lb. cloransulam-methyl (2) | **FirstRate 84DG 0.3-0.6 oz.** | Apply overtop prior to 50% flowering stage of soybeans. Application prior to full emergence of the first soybean trifoliate leaf may cause temporary yellowing. Good control of cocklebur, common ragweed, giant ragweed and sicklepod. Always add crop oil concentrate at 1.2 gal. per 100 gal. of spray mix. FirstRate can be tank-mixed with Roundup PowerMax (Roundup Ready soybeans only), and several other herbicides (see label). For FirstRate tank mixes with Roundup WeatherMax or PowerMax, DO NOT add additional surfactant or crop oil. Other glyphosate product tank-mixes add non-ionic surfactant at 2 pt. per 100 gals. If needed, a sequential application can be made. See label. |

| fomesafen (14) | 0.24-0.35 lb. fomesafen (14) | **Flexstar 1.0-1.5 pts.** | Contains same active ingredient as Reflex, but is formulated with an adjuvant system. Causes soybean foliar burn which is usually of short duration. Always add 1-2 qts. nonionic surfactant, or 0.5-1 gal. crop oil concentrate per 100 gals. of spray mix. Less incompatibility problems with glyphosate. Also sold premix as Flexstar GT 3.5. Other generic formulations available. |

<p>| fluazifop (1) | 0.094-0.188 lb. fluazifop (1) | <strong>Fusilade DX 2E 6-12 ozs.</strong> | Apply lower rate for most annual grasses before they exceed 4&quot; tall. For johnsongrass control, apply the higher rate when it is 8-18&quot; tall. Make a second application (8 ozs.) when regrowth is 6-12&quot; tall. For bermudagrass, apply the higher rate when runners are 4-8&quot; long, and repeat when regrowth reaches 4&quot;. Add oil concentrate (1 gal.) or nonionic surfactant (2 pts.) per 100 gal of spray mixture. Controls volunteer Roundup Ready corn in soybeans. |</p>

<tr>
<td><strong>glufosinate</strong> <strong>FOR USE ON</strong> <strong>GLUFOSINATE-TOLERANT SOYBEAN VARIETIES ONLY (10)</strong></td>
<td>0.4 – 0.66lb</td>
<td>Liberty 280 SL 22-36 ozs.</td>
<td>For control of glyphosate-resistant Palmer pigweed, horseweed and other weeds, apply early to small-sized weeds for best control. Will control Palmer up to 4 to 6” tall. A follow-up application of Liberty 7 to 10 days after the first application may be needed to control Palmer that is over 5” tall. Use at least 15 gallons/acre of water for more effective coverage. Apply up to a maximum of 65 oz/A prior to first bloom (R1) if no Liberty was used as a burndown treatment. R1 occurs approx. 40 days after planting for MG4 soybeans.</td>
</tr>
<tr>
<td>sethoxydim (1)</td>
<td>0.19 lb</td>
<td>Poast 1.5E or Poast Plus 1.0E 16 ozs. 1.5E or 24 ozs. 1.0E</td>
<td>Apply for control of most annual grasses. For best results, make applications before most grasses exceed 4” tall. Always include oil concentrate at 2 pts/A. Controls volunteer Roundup Ready corn in soybeans.</td>
</tr>
<tr>
<td>fomesafen + S-metolachlor (14+15)</td>
<td>1.32 lb (0.24 +1.09 lb)</td>
<td>Prefix 32 ozs.</td>
<td>May be applied from cracking through the third trifoliate.</td>
</tr>
<tr>
<td>imazethapyr (2)</td>
<td>0.063 lb</td>
<td>Pursuit 2AS or 70DG 4 fl. ozs.</td>
<td>Apply to control morning glory, spurge, pigweed, cocklebur and other broadleaf weeds. For most effective control, apply before weeds exceed 3” in height. Use nonionic surfactant at the rate of 1 qt. per 100 gallons of spray mix. Use 10 or more gallons of spray solution per acre to ensure good weed coverage. See label regarding rotational crop restrictions. Also available as a premix with glyphosate (Extreme) for use in Roundup Ready soybeans. See label.</td>
</tr>
<tr>
<td>flumetsulam (2)</td>
<td>Sandy loam: 0.04-0.045 lb Silt loam:silty clay loam: 0.045-0.055 lb</td>
<td>Python 80WDG 0.8-0.89 oz. 0.89-1.25 oz.</td>
<td>Use Python with a recommended grass herbicide for broad-spectrum control. Good control of pigweed, nightshade, spurge and velvetleaf. For hard-to-control weeds, such as sicklepod, apply 1.14-1.25 oz. on medium and fine textured soils. A nonionic surfactant at 0.25% must be included in all postemergence applications. Do not plant cotton within 18 months or grain sorghum within 12 months of application. See label for other rotational crops.</td>
</tr>
<tr>
<td>imazamox (2)</td>
<td>0.03-0.04 lb</td>
<td>Raptor 1AS 4-5 ozs.</td>
<td>Apply overhead prior to soybean bloom and before most weeds exceed 5” tall (see label). Good control of cocklebur, morning glory, pigweed, velvetleaf and seedling johnsongrass. Weak on sicklepod and hop hornbeam copperleaf. Always add either crop oil concentrate at 1 gal. per 100 gals. or nonionic surfactant at 1 qt. per 100 gals. of spray mix. Do not make more than one application per season.</td>
</tr>
<tr>
<td>fomesafen (14)</td>
<td>0.25-0.38 lb</td>
<td>Reflex 1-1.5 pts.</td>
<td>Apply to control morning glory (high rate only) and several broadleaf weeds. Add 1-2 qts. nonionic surfactant or 1 gal. crop oil concentrate per 100 gals. of spray. Reflex may be tank-mixed with glyphosate (Roundup Ready soybeans only) for improved control of morning glory and hemp sesbania (see label). It is usually very safe on soybeans. <strong>Do not plant sorghum within 10 months of application.</strong> Has controlled volunteer Roundup Ready cotton that is 6” or smaller in research and demonstration trials in soybean. May be less compatible when tank-mixed with glyphosate. Other generic formulations available.</td>
</tr>
<tr>
<td>flumiclorac (14)</td>
<td>0.03 lb</td>
<td>Resource 0.86E 4 ozs.</td>
<td>Apply to control velvetleaf with up to 6 leaves. Larger plants will require higher rates (see label). Add oil concentrate at 1 qt./A.</td>
</tr>
<tr>
<td>glyphosate (9)</td>
<td>1.1 lbs. (a.e.)</td>
<td>Roundup PowerMax4.5 ae 32 ozs.</td>
<td>See product labels for specific tank-mix directions. Applications can be made from the cracking stage up to R3 (1/4” pod visible on at least one of top 4 nodes on main stem). Dry conditions will reduce weed control.</td>
</tr>

*If a band treatment is used, the rate should be reduced proportionately according to band width and row spacing.

**For rhizome johnsongrass control, do not tank mix postemergence grass herbicides with broadleaf herbicides.
SOYBEAN HARVEST AIDS

Harvest aid products are sometimes needed to desiccate weeds in order to improve timeliness of harvest. This is most frequently encountered with early maturing varieties which may be ready for harvest prior to a killing frost. Harvest aid products do not speed up maturity of the soybean plant; they merely reduce moisture in weeds and may improve harvest efficiency, in addition to timeliness. Producers are encouraged to make harvest aid decisions by comparing cost with anticipated benefits. Also, care must be taken to minimize chances of drift to adjacent crops. Be sure to read labels thoroughly and follow required preharvest intervals (PHI).

**Glyphosate susceptible Junglerice/Barnyardgrass/Goosegrass/Johnsongrass also expect poor control of susceptible species when tankmixed with dicamba.

*Many hairs on upper leaf surface
 b No hairs on upper leaf surface
 c A few hairs on upper leaf surface

**KEY TO RESPONSE RATINGS:** 0=No control or crop injury; 10=100% control or severe, yield reducing crop injury; -----=No data available

Ratings are based on labeled rates of each herbicide, applied at the optimum timing for each weed.
Weeds can impact tobacco production by reducing yield, interfering with crop harvest, and contaminating cured leaf as Non-Tobacco Related Material (NTRM). Many of the common weed problems in tobacco are summer annuals such as foxtails, pigweeds, lambsquarters, and annual morningglories. In addition, some perennials such as Johnsongrass, honeyvine milkweed, and yellow nutsedge can be particularly troublesome in some tobacco fields. In locations where troublesome weeds are difficult to control it may become necessary to choose an alternative field site to grow tobacco. Table 1 is a guide to the relative response of selected weeds to various herbicides available for use in tobacco.

Land preparation practices such as moldboard plowing and diskng provide initial weed control by destroying early season weeds that emerge before transplanting. Field cultivation and hand-hoeing are also traditional methods to maintain good weed control post-transplant, but effective herbicide control options decrease the need for mechanical control methods. A foliar burn-down herbicide also allows production of tobacco by conservation tillage methods. Specific herbicide options that are currently recommended for use on tobacco fields are discussed in Table 1.

Use of certain herbicides on a previous crop can limit the rotational crops that can be planted in treated fields. For example, when atrazine is applied for weed control in corn during the previous growing season, there is a possibility that tobacco could be injured the year following application. Residual carryover from some pasture or forage crop herbicides can also severely damage tobacco planted in treated fields, sometimes for many years after the original application. Therefore, consult the herbicide labels to determine whether there is a risk to planting tobacco in fields that were used to grow other grain or forage crops. General rotational crop guidelines for herbicides available in grain crops can be found in the University of Tennessee Extension bulletin *Weed Control Manual for Tennessee* (PB 1580), the University of Kentucky Extension bulletin *Weed Control Recommendations for Kentucky Grain Crops* (AGR-6), the North Carolina Agricultural Chemicals Manual, or the Virginia Cooperative Extension Pest Management Guide for Field Crops (456-016).

Be familiar with label guidelines and rotational restrictions when applying tobacco herbicides. Limitations for some rotational crops are highlighted within the remarks for each herbicide listed in Table 1.

Conservation tillage (no-till, minimum till, and strip till) tobacco production systems have greatly increased in popularity in recent years in Tennessee. Helpful information about these systems can be found in Publication 1782 – 2019-2020 Burley and Dark Tobacco Production Guide.

| **Devrinol 50DF** 2-4 lb/A or **Devrinol DF-XT** 2-4 lb/A or **Devrinol 2-XT** 2-4 qt/A (napropamide 1-2 lb ai/A)  
[For use in Kentucky, Maryland, Virginia and Southeast Region only] | Barnyardgrass, broadleaf signalgrass, crabgrass, fall panicum, foxtails, purslane | May be applied over the top of transplants. Apply to a weed-free soil surface immediately after transplanting. If rainfall does not occur within 5 days after application, the treatment must be shallowly incorporated or irrigated-in. DEVRINOL may also be applied as a directed layby application to the row middles. (consult label). Small grains may be seeded in rotation in the fall to prevent soil erosion, but may be stunted. Small grains used as rotation crops must be plowed under or otherwise destroyed. To avoid injury to other crops not specified on the label, do not plant rotational crops until 12 months after the last DEVRINOL application. |

**After Transplanting—Postemergence Herbicides**

| Poast 1.5E 1.5 pt/A (sethoxydim 0.28 lb ai/A) + Crop Oil Concentrate 2 pt/A  
[NOTE: Consult labels for lower use rates if using other additives such as High Surfactant Oil Concentrates] | Barnyardgrass, broadleaf signalgrass, crabgrass, fall panicum, foxtails, johnsongrass, volunteer wheat | POAST herbicide provides selective postemergence control of annual and perennial grasses. Apply any time from transplanting up to 7 weeks after transplanting tobacco, but avoid applications within 42 days of harvest. For adequate control, ensure good spray coverage using a spray volume from 5 to 20 GPA (gallons per acre). Use of spray additives such as High Surfactant Oil Concentrates may result in increased risk of crop injury. Do not cultivate within 5 days before or 7 days after applying POAST. For rhizome Johsongrass, more than one application may be needed. Make the first application of POAST (1.5 pt/A) when johnsongrass plants are 20 to 25 inches, followed by a second application of POAST (1 pt/A) when regrowth is 12 inches. A maximum of 4 pt/A of POAST can be applied per season to tobacco. As a spot treatment, prepare a 1% to 1.5% solution (1.3 oz/gal to 2 oz/gal) of POAST plus a 1% solution of Oil Concentrate (1.3 oz/gal) and apply to the grass foliage on a spray-to-wet basis. Do not apply more than 4 pt/A per season to tobacco, including POAST applied to seedbeds. |

*This table should be used only as a guide for comparing the relative effectiveness of herbicides to a particular weed. Under extreme environmental conditions, the herbicide may perform better or worse than indicated in the table. If a grower is getting satisfactory results under their own conditions, products should not necessarily be changed as a result of the information in the table.*
WHEAT WEED CONTROL

Wild garlic, annual ryegrass and cheat are major weed problems in Tennessee wheat fields. Wild garlic infestations may cause dockage at harvest. Annual ryegrass and cheat compete with wheat for light, nutrients and water, and will reduce wheat yield. Weeds which infest wheat may delay harvest in the spring. Thus, an effective weed management program should be used for producing optimum wheat yields.

Good production practices aid in the control of weeds. Using weed-free seed, proper seeding rate, proper seedbed preparation, and planting following a good weed management program in a summer cultivated crop will assist in effective weed control.

Wild Garlic

A major weed problem in our wheat fields is wild garlic (commonly called wild onion). To obtain the best control of wild garlic and the least amount of injury to the wheat crop, the following procedure should be followed:

1. Apply 0.45 to 0.90 ounces Harmony Extra SG with TotalSol per acre.
2. Apply at least 15 gallons spray volume per acre to ensure coverage.
3. Add nonionic surfactant (80% active or greater) at a rate of 1 quart per 100 gallons of water. Liquid nitrogen fertilizer may be used as a spray carrier for Harmony Extra Total Sol. Surfactant must be included (1 to 2 pints per 100 gallons of spray solution). Wheat plants may exhibit temporary yellowing and stunting when sprayed with the liquid nitrogen.
4. Apply when wild garlic plants are less than 12 inches tall, with 2 to 4 inches of new growth. New growth is essential for control. See instructions in the table on the following page for wheat growth stage.
5. Apply when daytime temperatures of at least 60 F are expected for three or more days. Adequate soil moisture before, during and immediately after application will improve control.
6. Harvest wheat early, prior to excessive lodging, in order to remove as few aerial bulblets with the combine as possible.

No-till Wheat

A burndown application of Gramoxone SL may be needed to desiccate summer weeds such as broadleaf signalgrass, pigweed and cocklebur for easier planting and reduction of competition with emerging wheat. Additionally, Gramoxone SL will control winter annuals such as chickweed and henbit if they are already present at planting. Prior to planting wheat is also a good opportunity for control of perennial weeds such as johnsongrass, bermudagrass and some vines with Roundup PowerMax/others.

Ryegrass can be troublesome in no-till wheat just as it is in conventionally-tilled wheat. If Hoelon is used preemergence, it can be tank-mixed with Gramoxone SL.

Fall applications of Harmony Extra Total Sol have performed very well in no-till wheat on weeds such as wild garlic and dock. Harmony Extra Total Sol can be applied after wheat reaches the two-leaf stage. In most studies, the fall application has eliminated the need for a late-winter or spring application.

Wheat Harvest Aid

Roundup PowerMax (22 ozs./A) or Generics (32 ozs./A) may be applied preharvest in wheat for control or suppression of johnsongrass, smartweed and several other weeds (see label). Make applications after the hard-dough stage of grain (30 percent or less grain moisture) and at least seven days prior to harvest. May be applied either by ground or air. It is not recommended that wheat grown for seed be treated because a reduction in germination or vigor may occur.
## HERBICIDES FOR USE IN WHEAT

<table>
<thead>
<tr>
<th>Herbicide (site of action)</th>
<th>Rate/Acre Broadcast</th>

<td>-------------------</td>
<td>--------------------</td>
<td>---------</td>
</tr>
<tr>
<td>metribuzin</td>
<td>0.14-0.19 lb.(^A)</td>
<td><strong>Metribuzin 75DF</strong></td>
<td>Apply after the wheat plants have developed 3 to 4 tillers and have at least 4 secondary roots, 1” long. High moisture conditions may cause an underdeveloped root system. Crop tolerance is related to a good root system and healthy wheat plants prior to and at the time of application. Wheat varieties vary in their tolerance to Metribuzin. Various degrees of injury have been observed. <strong>Correct timing is critical or increased crop injury should be expected.</strong> Decisions regarding Metribuzin use on sensitive wheat varieties should be made by comparing expected yield loss from Metribuzin injury with yield loss from expected weed competition. See label for further instructions. Do not apply Metribuzin to wheat which has begun to joint. <strong>Alternative low rate program:</strong> Reduced rates of Metribuzin (1-3 ozs. /A of the 75DF formulation) may be applied on young wheat (2-leaf to 2-tiller stage). This treatment for cheat, little barley, chickweed and henbit has performed well in UT research and demonstrations. The 3 oz. rate will be required for control of one-leaf cheat and other weeds. This will normally require a fall application.</td>

*After emergence but before 3rd true leaf*

**KEY TO RESPONSE RATINGS:**

- **0** = No control;
- **10** = 100% control;
- ------ = Data not available.

Ratings are based on labeled rates of each herbicide, applied at the optimum timing for each weed.
SUNFLOWER WEED CONTROL

Sunflowers are routinely grown for doves and clean fields have historically produced better results. Although herbicides labeled for sunflower production are limited, good weed control can be obtained with proper application. It is recommended that sunflowers be drilled or seeded so that all seed are properly covered with soil. Broadcast seeding may result in poor seed to soil contact and herbicide applications may result in sunflower injury. Reduced rates of preemergence herbicides may be necessary for sunflowers planted on sandy or lighter textured silt loam soils to reduce the potential for injury. Activating rainfall or irrigation is needed for optimum preemergence herbicide activity and weed control.

PREPLANT INCORPORATED HERBICIDES FOR SUNFLOWERS

*For proper incorporation, a disk should be set to cut about twice as deep as placement is desired. A second mixing with shallow disking or field cultivator usually improves weed control. See label for incorporation instructions with other implements.

</tr>
<tr>
<td>Sulfentrazone + carfentrazone (14+14)</td>
<td>0.16 – 0.25 lbs</td>
<td>Spartan Charge 3.75 – 5.75 oz</td>
<td>Apply Spartan Charge alone or with other herbicides or liquid fertilizers as a burndown or preemergence treatment prior to planting or up to 3 days after planting sunflowers to control or suppress weeds.</td>
</tr>
</tbody>
</table>
**Postemergence Weed Control in Sunflowers**

Postemergence herbicides work best under the following conditions: weeds are young and rapidly growing, high humidity, good soil moisture, and good spray coverage. Performance is reduced when weeds are stressed due to drought, disease or cultivation, or when weeds are too large. Select the most effective weed management program for the money you can afford to spend. The following tables should assist with selection of a program for controlling your weeds.

### FORAGE CROP AND PASTURE WEED CONTROL

**HERBICIDES FOR ALFALFA AND OTHER LEGUME HAY CROPS**

<table>
<thead>
<tr>
<th>Crop and Application Timing</th>
<th>Herbicide</th>
<th>Active Ingredient</th>
<th>Formulation</th>
<th>Weeds Controlled, Remarks and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alfalfa-Preplant, No-Till</strong></td>
<td>Gramoxone 2SL (Paraquat)</td>
<td>0.63-1.0 lbs.</td>
<td>2.5-4.0 pts.</td>
<td>Use to control most annual and some perennial weeds prior to seeding. In sod, best results have been obtained with a split application (1.25-2.5 pts./A, 10 days to 3 weeks prior to planting, followed by 1.25 pts./A at planting). Apply in a minimum of 10 gals. of water/A. Add nonionic surfactant at 2 pts. per 100 gal. of spray mix.</td>
</tr>
<tr>
<td></td>
<td>Cornerstone/others** (Glyphosate 3ae)</td>
<td>0.75-2.25 lbs. (a.e.)</td>
<td>32-96 ozs. 3ae</td>
<td>For control of most annual weeds and better control of perennial weeds than Gramoxone Inteon. On most perennial weeds, glyphosate performs better in the fall than in the spring. See label for rates on individual weed species.</td>
</tr>
<tr>
<td></td>
<td>Roundup PowerMax or Roundup WeatherMax** (Glyphosate 4.5ae)</td>
<td>22-64 ozs. 4.5ae</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Alfalfa, Birdsfoot Trefoil, Ladino or Red Clover - Seedling</strong></td>
<td>Butyrac 200 2SC (2,4-DB)</td>
<td>1-1.5 lbs.</td>
<td>4-6 pts.</td>
<td>Controls small seedlings of musk thistle, turnips, cocklebur and ragweed. Does not control chickweed or henbit. Treat before weeds exceed 3 inches tall and when legume has two or more trifoliate leaves.</td>
</tr>
<tr>
<td><strong>Alfalfa, Birdsfoot Trefoil, Ladino or Red Clover – Seedling or Established</strong></td>
<td>Kerb 50WP (Pronamide)</td>
<td>0.75-1 lb.</td>
<td>1.5-2 lbs.</td>
<td>On pure alfalfa stands, use to control chickweed and several winter grasses such as ryegrass, cheat and annual bluegrass. Apply after legumes have reached the trifoliate stage. Do not apply if temperatures are above 55 F.</td>
</tr>
<tr>
<td><strong>Alfalfa, Seedling or Established</strong></td>
<td>Pursuit 2AS or 70DG (Imazethapyr)</td>
<td>0.063-0.094 lb.</td>
<td>4-6 ozs. 2AS or 1.44-2.16 ozs. 70DG</td>
<td>Apply overtop in seedling or established alfalfa to control several annual broadleaf weeds and some annual grasses. Higher rate required for grass control. Seedling alfalfa must be in the 2 trifoliate stage or larger. Apply before most weeds exceed 3 inches in height. Good control of pigweed, morningglory, cocklebur, foxtails and seedling johnsongrass. Always add nonionic surfactant at 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td><strong>Alfalfa, SEEDLING or ESTABLISHED</strong></td>
<td>Roundup WeatherMax (Glyphosate 4.5ae)</td>
<td>0.75-1.5 lbs.</td>
<td>22-44 ozs.</td>
<td><strong>Seedling alfalfa:</strong> Due to the biology and breeding constraints of alfalfa, up tp 10 percent of the seedlings may not contain a Roundup Ready gene and will not survive the first application of this product. To eliminate the undesirable effects of stand gaps created by this loss of plants, a single application of a least 22 ozs./A should be applied at or before the 4 trifoliate growth stage. Later applications may be made at up to 44 ozs./A. <strong>In established stands,</strong> apply up to 44 ozs./A. Do not apply within 5 days of cutting of first-year or established stands. Do not apply more than a total of 4.1 qts/A for in-crop applications.</td>
</tr>
<tr>
<td><strong>Roundup Ready Varieties Only</strong></td>
<td>Butyrac 200 2SC (2,4-DB)</td>
<td>1-1.5 lbs.</td>
<td>4-6 pts.</td>
<td>Controls small seedlings of musk thistle, turnips, cocklebur and ragweed. Does not control chickweed, henbit, plantain or dock. Treat before weeds exceed 3 inches tall.</td>
</tr>
<tr>
<td><strong>Alfalfa, Clover, Birdsfoot Trefoil - Seedling or Established</strong></td>
<td>Poast 1.5E (Sethoxydim)</td>
<td>0.19-0.28 lb.</td>
<td>1-2.5 pts. 1.5E</td>
<td>Apply low rate overtop to seedling or established crop for control of crabgrass, goosegrass, foxtails and other annual grasses. Use higher rate for johnsongrass and bermudagrass. A second application may be needed for control of regrowth. Always add crop oil concentrate at 2 pts./A.</td>
</tr>
<tr>
<td><strong>Alfalfa, Birdsfoot Trefoil - Seedling or Established</strong></td>
<td>Select Max (Clodethi)</td>
<td>0.07 – 0.12 lb.</td>
<td>9 – 16 ozs.</td>
<td>Apply overtop to control crabgrass, fall panicum, broadleaf signalgrass or other annual grasses and johnsongrass. Use 9 to 16 ozs./A in seedling alfalfa and 12 to 16 ozs./A in established alfalfa for annual grasses. Use 12 ozs./A for johnsongrass and bermudagrass and follow with a second application if needed. See label. Always add crop oil concentrate at 1 qt./A.</td>
</tr>

</thead>
<tbody>
<tr>
<td>Alfalfa - Dormant</td>
<td>Gramoxone 2SL (Paraquat)</td>
<td>0.19-0.31 lb.</td>
<td>0.75-1.25 pts.</td>
<td>Apply to dormant, pure alfalfa during late fall or winter months for control of chickweed, henbit, bluegrass and downy brome, and suppression of perennial grasses including orchardgrass, timothy, and smooth brome. Use a minimum of 10 gallons of water by ground, or 5 gallons of water by air. Always add a nonionic surfactant at 0.25% (1 qt. per 100 gallons of spray mix.) Application to alfalfa that is not dormant, or has broken dormancy, may result in stand and/or yield reductions. Replanting may be necessary. Green alfalfa foliage present at the time of application will be burned. Make only one application per season.</td>
</tr>
<tr>
<td>Alfalfa - Dormant</td>
<td>Sencor or Lexone 4 L or 75 DF (Metribuzin)</td>
<td>0.5-0.75 lb.</td>
<td>1-1.5 pts. 4L, or 0.67-1 lb. 75 DF</td>
<td></td>

# HERBICIDES FOR GRASS PASTURES AND HAY FIELDS *

<table>
<thead>
<tr>
<th>Crop and Application Timing</th>
<th>Herbicide</th>
<th>Active Ingredient</th>
<th>Formulation</th>
<th>Weeds Controlled, Remarks and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bermudagrass only Established, Dormant</td>
<td>Gramoxone 2SL (Paraquat)</td>
<td>0.25-0.5 lb.</td>
<td>1.0-2.0 pts.</td>
<td>Apply to dormant bermudagrass for control or suppression of emerged winter annual weeds. For control of little barley, apply before the mid-boot stage. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Bermudagrass only Established, Dormant</td>
<td>Roundup PowerMax 4.5 ae or Roundup WeatherMax 4.5 ae (glyphosate)</td>
<td>0.28-0.39 lb.</td>
<td>8-11 oz.</td>
<td>Apply 8-11 oz./A to dormant bermudagrass in late winter to early spring. Higher rates may be used, but injury will occur if bermudagrass has broken dormancy. Applications may be made in late fall, also, if bermudagrass is dormant.</td>
</tr>
<tr>
<td>Bermudagrass only First-year or Established</td>
<td>Cimarron Plus 63WG (metsulfuron+ chlorsulfuron)</td>
<td>0.06 + 0.019 oz. to 0.3+0.094 oz.</td>
<td>0.125-0.625 oz.</td>
<td>Bermudagrass should be established at least 60 days prior to application. Apply before weeds are 4 inches tall or in diameter. Rate depends upon target weeds. See label. Add nonionic surfactant at 1 to 2 pts./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Bermudagrass only Established</td>
<td>Outrider 75 DF (sulfosulfuron)</td>
<td>0.56-1.5 oz.</td>
<td>0.75-2.0 oz.</td>
<td>Apply overtop for control of johnsongrass and nutsedge. Does not control summer annual grasses nor most broadleaves. Always add nonionic surfactant at 1 qt./100 gal. of spray mix. Applications of 1.25 oz./A have performed well on 18-24 in. johnsongrass. Temporary bermudagrass stunting may occur. Grass may be grazed immediately; do not harvest for hay for 14 days.</td>
</tr>
<tr>
<td>Bermudagrass only Established</td>
<td>Pastora 71.2 WG (Nicosulfuron + metsulfuron)</td>
<td>0.56+0.15 oz. To 0.84+0.23 oz.</td>
<td>1-1.5 oz.</td>
<td>Pastora is a premixture of the active ingredients in Accent and Escort herbicides. Apply overtop to control johnsongrass, broadleaf signalgrass, barnyardgrass, fall panicum, foxtails and many broadleaf weeds. <strong>Does not control crabgrass or dallisgrass.</strong> Always add nonionic surfactant at 1 qt./100 gal. of spray mix. Noticeable growth reduction and discoloration following application usually occurs, but bermudagrass will recover. Injury may be reduced by applying when bermudagrass has less than 2 in. of new growth following green-up, or within 7 days following hay harvest. Pastora has no grazing or hay cutting restrictions.</td>
</tr>
<tr>
<td>Seedling Forage Grasses</td>
<td>Aim 2EC (carfentrazone)</td>
<td>0.016-0.023 lb.</td>
<td>1.0-1.5 oz.</td>
<td>Apply to seedling forage grasses no sooner than 7 days following emergence. Use for control of a limited number of broadleaved weeds, under 4 inches tall, such as pigweeds, black nightshade, lambsquarters, and velvetleaf. Do not make applications less than 7 days apart. Always add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Seedling Forage Grasses</td>
<td>2,4-D Amine 4L</td>
<td>0.5-0.75 lb.</td>
<td>1-1.5 pts.</td>
<td>Can be used on all forage grasses for control of buttercup, thistles, wild turnip, horseweed and plantain. Apply when weeds are less than 4 in. tall and actively growing. This treatment will kill clovers and other legumes in the seedling stage. Do not apply if seedling grasses do not show good vigor. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Crop and Application Timing</td>
<td>Herbicide</td>
<td>Active Ingredient</td>
<td>Formulation</td>
<td>Weeds Controlled, Remarks and Precautions</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------</td>
<td>-----------------------------------</td>
<td>-------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>First-Year and Established Forage Grasses</td>
<td>GrazonNext HL</td>
<td>0.06 + 0.5 – 0.11 + 0.87 lbs.</td>
<td>1.2-2.1 pts.</td>
<td>During the year of establishment, apply after grasses have begun to tiller, develop a good secondary root system, and show good vigor. Use for control of buttercups, thistles, cocklebur, pigweeds, bitter sneezeweed, horsemintle, tall ironweed, plantains, and several others. See label for individual weed rates. Will kill pasture legumes, but reseeding may be possible one year later (see label). Always add a nonionic surfactant at the rate of 1 qt./100 gal. of spray mix. Do not use grasses treated with GrazonNext HL in the preceeding 18 months for hay intended for export outside the United States. Do not use hay or straw from areas treated with GrazonNext HL within the preceeding 18 months, or maure from animals feeding on hay treated with GrazonNext HL, in compost. Do not use grasses treated within the preceeding 18 months for seed production.</td>
</tr>
<tr>
<td>First-Year and Established Forage Grasses</td>
<td>Grazon P+D <strong>For use only in approved TN counties.</strong></td>
<td>0.14 + 0.5 – 0.2 + 0.75 lb.</td>
<td>2-3 pts.</td>
<td>This is a Restricted Use Pesticide (RUP) which requires a license to purchase and apply. Apply after newly seeded grasses have begun to tiller and develop a secondary root system (usually around the 4-leaf stage of grasses). Use for thistles, horsemintle, ragweed, cocklebur, buttercup and others. Will kill pasture legumes, but reseeding may be possible one year later. On most weeds apply in March to mid-summer when actively growing. Most perennials will require higher rates (see label). Always add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Established Grass and White Clover Mixtures</td>
<td>2,4-D Amine 4L OR 2,4-D Low Volatile Ester 4EC</td>
<td>0.75-1.0 lb.</td>
<td>1.5-2 pts.</td>
<td>Can be used on all established mixtures of grass and white clover. Apply in March to early April for control of buttercup, musk thistle, dandelion and plantain. Apply in June for control of cocklebur, bitter sneezeweed, pigweed, spiny amaranth and ragweed. NOTE: The amine formulation is less volatile than low volatile ester formulations, but is less effective on hard-to-control species such as thistles, plantain and other perennials. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Established, Grass and Annual Lespedeza Mixtures</td>
<td>2,4-D Amine 4L</td>
<td>0.5-0.75 lb.</td>
<td>1-1.5 pts.</td>
<td>Can be applied when lespedeza is 3 to 7 inches tall (normally mid-June). Earlier applications will result in more severe injury. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Established Forage Grasses</td>
<td>2,4-D Ester 4EC</td>
<td>2.0 lb.</td>
<td>2 qts.</td>
<td>For wild garlic control, apply in October to mid-December or March to mid-April when daytime temperature is at least 65 F. Repeat twice annually for 2 years to eliminate wild garlic. This same program is effective on buckhorn plantain. This rate of 2,4-D will kill all legumes, including established white clover. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Established Forage Grasses</td>
<td>PastureGard HL</td>
<td>0.38 + 0.13 - 1.5 + 0.5</td>
<td>1-4 pts.</td>
<td>Use when brush or woody plants have begun to establish in pasture. May be tank-mixed with other products to improve control of herbaceous weeds. Excellent control of sericea lespedeza. Especially good on blackberry and other woody plants. For woody plant control, apply in summer after plants have fully leafed out. For blackberry, apply in summer after fruit drop when good moisture is available. May be used on fencerows and for individual plant treatments of trees and brush. Always add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td>Crop and Application Timing</td>
<td>Herbicide</td>
<td>Active Ingredient</td>
<td>Formulation</td>
<td>Weeds Controlled, Remarks and Precautions</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------</td>
<td>-------------------</td>
<td>-------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>Established Forage Grasses</td>
<td>Surmount</td>
<td>0.13 + 0.13-0.5 + 0.5</td>
<td>1.5 – 6 pts.</td>
<td>This is a Restricted Use Pesticide (RUP) which requires a license to purchase and apply. Use for brush control plus residual broadleaf weed control. Especially good on blackberry, ironweed, horsernettle, thistles, etc. For woody plant control, apply in summer after plants have fully leafed out. For blackberry, apply in summer after fruit drop when good moisture is available. Usual broadcast rates for woody plant control: 3-4 pints/acre. Always add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix.</td>
</tr>
<tr>
<td></td>
<td>Brash/Range Star/Weedmaster 3.87SL (Dicamba + 2,4-D Amine)</td>
<td>(0.125 + 0.36) to (0.5 + 1.4 lbs.)</td>
<td>1-4 pts.</td>
<td>Will usually give control of a wider range of weeds than either herbicide alone. Only partially effective on difficult-to-control perennials such as dock, brambles and horsernettle. High rates (see label) required for difficult-to-control species. Will kill all pasture legumes. Add nonionic surfactant at the rate of 1 qt./100 gal. of spray mix. <strong>Note:</strong> In late 2017 the United States Environmental Protection Agency reclassified dicamba as a Restricted-Use Pesticide.</td>
</tr>
<tr>
<td>Established Tall Fescue</td>
<td>Outrider 75WDG (sulfosulfuron)</td>
<td>0.04 lb.</td>
<td>0.75 oz.</td>
<td>For use only in established tall fescue. Do not apply to orchardgrass, timothy and other forage grasses (Except for established bermudagrass). Apply 0.75 oz./A to well-established tall fescue for johnsongrass control. To minimize yellowing and stunting, do not exceed 0.75 oz./A and apply during summer when fescue is dormant or growth has slowed. Always add nonionic surfactant at 0.25% v/v (1 qt./100 gal. of spray mix). See label for directions and precautions and allowable tank mix partners.</td>
</tr>
<tr>
<td>Sorghum-Sudangrass Hybrids - Postemergence</td>
<td>AAtrex 4L or 90WDG (Atrazine)</td>
<td>2.0 lbs.</td>
<td>2 qts. or 2.2 lbs.</td>
<td>Apply overtop once a stand is obtained and before weeds exceed 1.5 inches in height. Do not apply after crop is 12 inches in height. See label for surface and groundwater protection measures. Atrazine is not labeled on sweet sorghum.</td>
</tr>
</tbody>
</table>

*See Table for Grazing, Hay Cutting and Slaughter Restrictions.

**Pasture and Grass Hay Herbicide Residues – Precautions and Reminders**

Certain pasture herbicides (GrazonNext HL, Grazon P+D, and Surmount) contain active ingredients which may persist in treated soil, grass, harvested hay, and in cattle manure and urine. Numerous broadleaf crops, garden vegetables and ornamentals are very sensitive to minute amounts of these active ingredients. Because of this, careful planning is required regarding use of treated pastures and hay, in the movement of animals which have been grazing in treated pastures or which have been fed treated hay, and in the use of manure from animals which have been grazing in treated pastures or which have been fed treated hay. These herbicides are for use in permanent grass pastures and grass hay fields only. They should not be used in fields which will be rotated to broadleaf crops.

Manure from animals which have been grazing treated pastures or which have been fed treated hay should not be used to fertilize broadleaf crops or home gardens unless the animals have been withdrawn from treated pastures or hay (3 days for GrazonNext HL, 7 days for Grazon P+D and Surmount). Likewise, treated hay should not be used for mulch in vegetable production, gardens or landscape beds. Do not transfer animals which have been grazing treated pastures or which have been fed treated hay to fields which will be rotated to sensitive crops unless they have been withdrawn from treated pastures or hay (3 days for GrazonNext HL, 7 days for Grazon P+D and Surmount).

For more information on how to avoid these problems, please go to our website: herbicidestewardship.com

Spurge Control in Tall Fescue Pastures and Hay Fields

Problems with nodding spurge (Chamaesyce nutans) in tall fescue pastures and hay fields have increased dramatically across Tennessee in recent years. The recent dry summers and their impact on grass stands have certainly helped create this situation. Nodding spurge is a summer annual broadleaf weed which generally appears in June in pastures or after first hay cutting in hay fields. Unfortunately, most all of our herbicides commonly used (2,4-D, GrazonNext HL, Grazon P+D, Brash/Range Star/Weedmaster, etc.) are ineffective on nodding spurge. Cimmarron Plus (metsulfuron+chlorosulfuron) and other products which contain metsulfuron, such as Chaparral (aminopyralid + metsulfuron), provide excellent control. While metsulfuron is safe on bermudagrass and established orchardgrass, it causes noticeable temporary yellowing, stunting and seedhead suppression in tall fescue. Producers who are experiencing problems with nodding spurge and who are willing to accept the injury to tall fescue may want to consider applying Cimarron Plus (0.2 to 0.3 oz/A) or Chaparral (1.5 to 2 oz/A). Add nonionic surfactant at the rate of 1 qt/100 gal of spray mixture. Tall fescue must be established for at least 24 months before applying metsulfuron-containing products.

See Table for Grazing, Hay Cutting and Slaughter Restrictions
Grazon P+D and Surmount Guidelines for Tennessee

Grazon P+D and Surmount are marketed in a limited number of counties in Tennessee. These counties were chosen because they have little or no acreage of cotton, tobacco, and certain other sensitive crops or because the counties have had a history of Grazon P+D use without non-target problem. The University of Tennessee does not recommend the use of Grazon P+D or Surmount outside of these counties. See figure on page 83 of this manual.

Grazon P+D and Surmount are safe on established cool-and warm-season grasses used for pasture and hay production. They provide good control of a number of broadleaf weeds. Both provide some residual control. The residual effect will depend on temperature, soil type, moisture and plant sensitivity. These products will kill all pasture legumes and re-seeding should not be attempted within one year of application.

Grazon P+D and Surmount are restricted use pesticides, requiring applicators to have a commercial pesticide applicator certification card. They are restricted use due to the risk of injury to susceptible, non-target plants. Broadleaf crops, like cotton, tobacco, tomatoes and others, are very sensitive to both herbicides. Care must be taken in use of hay from fields treated with Grazon P+D or Surmount. Do not spread manure from animals which have grazed on, or have been fed hay on fields where picloram sensitive crops will be grown. Due to this sensitivity, it is recommended to use a sprayer dedicated to pasture applications only. Read and understand the label restrictions before use of this product.

Check List for Grazon P+D and Surmount Use
If all of the following are answered as “satisfactory,” then an application of Grazon P+D or Surmount may be recommended.

1. Is the site located within one of the approved counties for this herbicide?
2. Does the applicator have a restricted use applicator certification or use a custom applicator?
3. Is the site properly buffered from sensitive crops and other off-target species, including ornamentals?
4. Is there surface water (ponds or streams) on site? If so, does the applicator know to keep a 50 foot buffer?
5. Has the required personal protective equipment been prepared?
6. Are the wind conditions calm enough to prevent drift?
7. Is rain in the forecast? If so, the application should be delayed.
8. Does the applicator / land manager understand the grazing, haying and manure restrictions (see label)?
9. Is there a risk of surface runoff of the herbicide, including erosion? (e.g., does the site contain steep slopes with bare soil?) If so, the application is not recommended.
10. Is the site a permanent pasture? (If there is intention to rotate to any field crops, ornamentals, tobacco, vegetables or other vegetation, application is not recommended.)
11. Does the applicator understand the sprayer cleanout requirements?

WEED MANAGEMENT IN FARM PONDS
G. Neil Rhodes, Jr., Professor and Extension Weed Management Specialist

Introduction

Ponds are valuable resources in our state. Many producers and landowners rely on them for watering livestock, irrigating tobacco, vegetables and other crops, recreational fishing and swimming. Aquatic plants (algae and higher plants) are essential for a balanced aquatic ecosystem. First and foremost, plants (particularly planktonic algae) provide oxygen for fish and other aquatic animals, and they provide cover and breeding habitat for these same organisms. Unfortunately, this balance is often hard to maintain and aquatic plants can become weeds due to excessive growth.

Aquatic weeds may be divided into four general groups: algae (planktonic, filamentous); floating weeds (duckweed, watermeal, water hyacinth, etc.); submersed weeds (naiads, pondweeds, coontail, hydilla, watermilfoil, etc.); and emergent or marginal weeds (cattail, water lilies, grasses, arrowhead, etc.). Proper identification of weeds is critical before attempting a management strategy.

In general, aquatic weeds grow in response to nutrient inputs. Ponds which receive runoff from livestock holding areas or fertilized fields, or ponds where livestock have free access will usually have weed problems every year. The most common problems in these areas are algae (planktonic and filamentous), duckweed and watermeal. Herbicide treatments will only provide temporary control. Grass carp may be useful for biological control of certain aquatic weeds. In general, these plant-eating fish are much more effective on submersed weeds than on emergent or floating weeds. Information on grass carp and stocking rates may be found also in Managing Small Fishing Ponds and Lakes in Tennessee by the Tennessee Wildlife Resources Agency (http://www.tn.gov/twra/fish/pond/pondmang.html). Also, consider contacting the Southern Regional Aquaculture Center (http://srac.tamu.edu) for a complete listing of current aquatic weed control fact sheets.

Biological Control Methods

Triploid Grass Carp

Grass carp, also known as white amur, must be triploid (sterile) in order to be sold and stocked in private lakes and ponds in Tennessee. New ponds can be stocked with 2- to 6-inch grass carp at a rate of 5 fish/acre as a preventative measure. In ponds with existing bass populations, grass carp at least 8 to 10 inches long must be stocked to avoid having them eaten by the bass. If you have a problem with a weed that grass carp are known to consume, stocking rates of at least 15 to 30 fish/acre are required to provide control within a year or two. When more immediate results are required, applying a herbicide followed by stocking of grass carp (once the treated weeds have decomposed) may be the best option. Grass carp are capable of fast growth and can reach 20 to 25 pounds in weight. As these fish become older and mature, their rate of weed consumption declines, and additional fish should be stocked every 3 to 5 years.

Tilapia

Three tilapia species are legal to stock into private lakes and ponds in Tennessee: blue tilapia, Nile tilapia, and Mozambique tilapia. Tilapia are non-native tropical fish that will not overwinter in Tennessee and will require restocking. After water temperatures reach 60-65 F in the spring, stock tilapia at 15-20 pounds per acre for control of watermeal and filamentous algae. Tilapia should be at least three inches long to deter predation, but often will not provide adequate weed control if the pond has a robust bass population.

Cultural and Physical Control Methods

Prevention

Aquatic weed management begins with pond construction. The depth at the shoreline should be about 3 feet to reduce aquatic weed and algae growth at the pond edge. Ponds which have extensive areas of shallow (less than 2 feet deep) water are prone to have weed problems due to ready penetration of sunlight to the bottom of the pond. Planktonic algae growths can actually reduce certain submersed weed problems in properly constructed ponds due to shading of the bottom. This is one of the reasons why fertilization of farm ponds is sometimes recommended. Fertilization must, however, be done properly. For information on farm pond fertilization, please refer to Managing Small Fishing Ponds and Lakes in Tennessee. Excess nutrients from farming and landscaping practices support the growth of unwanted vegetation. It is important to reduce nutrient loading near the pond and consider planting buffer strips of desirable vegetation to intercept excess nutrients.

Dyes

Several non-toxic dyes are available that control filamentous algae and some submersed species by blocking light penetration for up to six weeks after application. They may be used in lakes, ponds, ornamental ponds and fountains, and commercial fish ponds that have little or no outflow. Apply labeled rates in the early spring before weed growth begins, or apply when plants are seen on the bottom of the pond. Additional applications will be necessary throughout the year. These dyes are non-toxic to livestock, but must not be applied in water supplies that will be used for human consumption or any body of water not under total control of the user.
Chemical Control Methods – Herbicides

Aquatic herbicides should be used only as a last resort. The use of these chemicals is very restrictive due to use of water for domestic consumption, livestock watering, irrigation, swimming and fishing. It is essential that aquatic herbicides be used in strict accordance with label directions. Also, just because a herbicide is labeled for one aquatic site does not mean that it can be used in all aquatic situations. For example, some materials are labeled for ditchbanks, but not for ponds or lakes. Most herbicides also have specific waiting periods between application and various uses of the water (fishing, irrigation, livestock watering, etc.). Be sure to thoroughly read the label prior to purchasing aquatic herbicides. Do not attempt to use them if you do not understand the instructions on the label, or if you do not intend to follow them. Most aquatic herbicides, when used according to the label, are not toxic to fish. The greatest risk of harm to fish comes from oxygen depletion which occurs as the weeds decay. Applications should be made early in the season. At this time, weeds are actively growing, the amount of vegetation for decay is lower, and the cooler water generally contains higher levels of dissolved oxygen. Most aquatic weeds begin growth in the early spring when water temperatures are 55 to 60°F. Early treatment, treatment of only portions of the pond at one time, and mechanical aeration will reduce the risk of oxygen depletion.

Aquatic herbicide rates are expressed in different ways, depending on the individual chemical. Some are expressed as amount of chemical per surface acre of water, and others are expressed as amount per acre-foot of water. One acre-foot of water is one surface acre of water, one foot deep. For example, a three-acre pond averaging five feet deep would contain 15 acre-feet of water. Other rates are expressed as parts per million (ppm). One ppm is 2.7 lbs. of chemical per acre foot.

Copper Sulfate

Copper sulfate is recommended for algae control in this publication. However, even the low rates listed on the label for “soft” waters could cause a fish kill in very low alkalinity waters common in Tennessee farm ponds, particularly if large areas are treated at one time. Trout are particularly sensitive to copper.

Where loss of fish is of concern, it is important to check the total alkalinity of the water before recommending treatment with copper sulfate. If the alkalinity is below 50 mg/L, copper sulfate should not be used. It is important to treat only one-third of a body of water at a time to avoid dissolved oxygen problems or direct toxicity to fish. Fish can sense copper in the water and will move away from treated areas. Mechanical aeration will reduce the risk of oxygen depletion.

Algicides containing sodium carbonate peroxyhydrate as the active ingredient are becoming increasingly popular. After application to water, it forms hydrogen peroxide that rapidly attacks algal cells. Applications should be made with at least 8-10 hours of sunlight remaining to enhance efficacy. There are no water use restrictions associated with these products. However, rapid decay of algae can decrease the amount of dissolved oxygen available to fish. Applicators should follow the same precautions as other aquatic herbicides when treating ponds to reduce the risk of oxygen depletion.

Specific Weeds

Watermeal

A surface layer of this floating weed will prevent sunlight from reaching into the pond. As a result, algae and submerged plants can no longer produce oxygen through photosynthesis. This lack of oxygen can greatly stress or even kill fish. This plant is typically found in nutrient rich environments ranging from trees around the edge, failing septic fields, or livestock (including waterfowl) waste. Bottom sediments will be black and have a disagreeable odor. Watermeal can be spread to ponds by “hitchhiking” on livestock, pets, and birds. Fluridone (Sonar, Avast) can be applied as an in-water treatment in ponds with little or no outflow. Flumioxazin (Clipper) may be applied at a rate of 8 to 12 oz per surface acre or as an in-water treatment at a rate of 1 to 2 lbs per acre foot of water. Flumioxazin will rapidly degrade and lose effectiveness in water with pH>8.5. Applications made early in the morning before the pH begins to rise have shown the best results. Other methods for watermeal control include reducing nutrient loading and stocking tilapia. Tilapia, however, will not overwinter in Tennessee. Restocking will be required.

Filamentous Algae

This group of algae, commonly referred to as “pond scum” or “moss”, form mats on the pond surface in early spring. The algae usually begin along edges or in the bottom, often attached to underwater structures. Proper identification of filamentous algae is critical, as species have different susceptibilities to control options. The use of copper complexes, such as chelated copper, has given excellent control to most species when applied to the area in early spring. It is important to break up thick mats of filamentous algae to increase the surface area contact with algicides.

Watershield

Watershield, or dollarbonnet, is a perennial floating-leaved plant common throughout much of Tennessee. Plants can quickly spread around the perimeter of ponds. Mechanical control is difficult because plants can reestablish from seeds and rhizomes. Applications of granular 2,4-D (Navigate) should be made early in the growing season at a rate of 150 to 200 lbs per acre. Glyphosate, imazapyr, or triclopyr can be applied as a foliar treatment to leaves floating on the surface. Use of non-ionic surfactants approved for aquatic use is recommended. Also, avoid disturbing surface water after application so that herbicides have enough time to absorb into the plant.
## AQUATIC HERBICIDES FOR WEED CONTROL IN FARM PONDS

Richardson, Associate Professor, Crop Science Department, North Carolina State University and the Southern Regional Aquaculture Center.*
Sprayer Calibration

Accurate application of herbicides is essential to adequately control weeds, avoid excessive crop injury and to get the most for your investment in chemicals. This has become even more critical in recent years as we have seen some herbicide rates go from pounds per acre to fractions of one ounce per acre. Sprayer calibration, unfortunately, is often neglected or avoided. There are many ways to calibrate a sprayer, some more difficult than others. The bottom line is if you have a reliable method with which you are comfortable, stick with it. The following information is provided as a guide to a couple of simple, straightforward methods.

Regardless of the method, sprayer calibration should be done with clean water, not with the chemical mix in the spray system. Prior to beginning calibration, thoroughly clean your sprayer. Also, be sure to check for nozzle uniformity, as defects or uneven wear may cause some nozzles to put out significantly more than others of the same type. To do this, catch and measure the output of each nozzle for a specific length of time (30 seconds, 1 minute, etc.) and determine the average output per nozzle (total combined output of all nozzles divided by the number of nozzles). Discard and replace any nozzle that varies more than 5 percent from the average.

Spray-an-acre method

This is perhaps the most direct method. The procedure is as follows:

1. Measure and flag the boundaries of one acre of ground similar to your fields.
2. Select a gear and engine speed combination which will allow you to comfortably drive across your fields and develop adequate spray pressure for the particular spray nozzles on your rig.
3. On level ground, fill the spray tank completely or to a recorded mark on the tank or sight gauge.
4. With the sprayer operating, drive the rig over the measured acre while spraying water at the preselected engine speed and gear combination.
5. Return to the level spot where you filled the sprayer. Measure how many gallons of water it takes to refill the sprayer or to return the water level to your recorded mark. This number of gallons equals gallons per acre.

A modification of this procedure involves spraying one-half acre. Follow the above procedure and multiply the gallons required to refill by 2.

1/128 acre method

This is perhaps the most frequently used and quickest method of calibration. Unlike the previous method, it involves measuring a specific driving distance rather than an area. Follow these steps to calibrate by the 1/128 acre method.

1. Measure a specific distance in a field according to the table below. Select a driving distance which matches the nozzle spacing on your boom (for broadcast sprays) or row spacing you use (for band applications). The distance should be measured in a field typical of those you will be spraying.

<table>
<thead>
<tr>
<th>Nozzle or Row spacing (inches)</th>

<td>14</td>
<td>291</td>
</tr>
</tbody>
</table>
2. Select a gear and engine speed combination which will allow you to comfortably drive across your fields and develop adequate spray pressure for the particular nozzles on your rig. Drive the measured distance at the preselected gear and engine speed combination and record the time required to drive the distance in seconds. To improve precision, you may want to time two separate runs and take the average of two runs.

3. Park the sprayer and using a measuring cup or bucket, catch the spray output from a single nozzle for the length of time it took you to drive the measured distance in step one. Be sure the sprayer is running at the same engine speed and spray pressure. Note: For banding rigs where you used row spacing to determine the distance in step 1 and where more than one nozzle is directed to the row, catch the output for all nozzles directed to a single row.

4. The total amount of water, measured in ounces, collected per nozzle or row in step 3 equals gallons per acre (GPA).

**Determining how much chemical to add to the tank**

Now that you have successfully calibrated your sprayer, the next step is to determine how much chemical you need to add to the tank.

1. Divide the tank capacity by gallons per acre to calculate the number of acres a full tank can spray.

   \[ \text{Tank capacity (gallons)} = \frac{\text{Number of acres covered by one full tank}}{\text{GPA}} \]

2. Multiply the recommended herbicide rate (pts./A, oz./A, lbs./A, etc.) by the number of acres covered by a full tank.

3. Note: All herbicide rates in this weed control manual are expressed as broadcast rates. For band applications, you must adjust the rate using the following formula:

   \[ \frac{\text{Band Width} \times \text{Broadcast Rate}}{\text{Row Width}} = \text{Band Rate} \]

Use the previous formula to adjust rates if you have calibrated your sprayer on a row width basis for band applications.

**Calibration Examples**

**Broadcast Application**

A producer plans to spray Gramoxone plus nonionic surfactant for burndown on corn ground. His sprayer has a uniform nozzle spacing of 18 inches. He has thoroughly cleaned his sprayer and replaced all nonuniform nozzles.

1. From the chart, note that the distance to drive is 227 feet. Measure this distance in the field to be sprayed.
2. At the desired engine speed and gear combination, let’s assume it took 39 seconds to cover 227 feet. This is 4 mph.
3. At the same engine speed and spray pressure, catch the output in ounces. Our producer caught 20 ounces during the 39 second time period. Output is therefore 20 GPA.
4. After reading the Gramoxone label and the weed control manual recommendations for corn, he decides to spray Gramoxone at 1.5 pts./A plus nonionic surfactant at 1 qt./100 gallons of spray mix. Let’s assume he has a 300 gallon spray tank.

   \[ \frac{300 \text{ gal per tank load}}{20 \text{ GPA}} = 15 \text{ acres covered by one tank load} \]

   \[ 1.5 \text{ pts./A} \times 15 \text{ acres} = 22.5 \text{ pints (2.8 gallons) of Gramoxone Max per tank load} \]

What about the surfactant?

\[ 300 \text{ gal.} \times \frac{1 \text{ qt.}}{100 \text{ gal.}} = 3 \text{ qts. per tank load} \]
**Band Application**

A producer wants to apply Staple plus nonionic surfactant in a 19 inch band on 38-inch rows. His banding rig is set up with three nozzles directed to the band on each row. The sprayer has been thoroughly cleaned, and the nozzles are uniform in output.

1. The distance to travel for a 38 inch row is 107 feet. The course is measured and he drives it. Let’s assume it took 18 seconds (4 mph).
2. Park the sprayer and at the same engine speed and pressure, collect the output of each of the three nozzles for 18 seconds. If the combined total output of the three nozzles is, for example, 25 ounces, the sprayer is applying 25 gallons per acre.
3. The sprayer has a 200 gallon tank. The *broadcast rate* for Staple is 1.2 oz./A, and nonionic surfactant is to be added at 1 qt./100 gal. of spray mix.

\[
\text{200 gal. tank} = \frac{8 \text{ acres covered per tank}}{25 \text{ GPA}}
\]

4. Now, reduce the rate for a 19 inch band.

\[
\text{19 inch band} \times 1.2 \text{ oz./A} = 0.6 \text{ oz.}
\]

\[
\frac{38 \text{ inch row}}{8 \text{ acres}} \times 0.6 \text{ oz./A} = 4.8 \text{ oz. Staple per tank}
\]

\[
\text{200 gallons} \times 1 \text{ qt./100 gal.} = 2 \text{ qts. nonionic surfactant per tank}
\]

Note that since the surfactant rate in this example is based on amount per volume of spray mix, rather than amount per acre, it is calculated the same as for broadcast applications.

**Post-Directed and Hooded Applications**

A producer plans to use a hooded sprayer to make post-directed and hooded applications in his 38-inch row cotton. The producer realizes that the gallons per acre (GPA) under the hood needs to be as close as possible to the GPA of his post-directed band. The hooded rig is set up to use two nozzles post-directing on a 13-inch band and has three nozzles under the hood spraying a 25-inch band.

**Scenario 1: One pump applying one tank mix.**

1. The distance to travel for a 38 inch row is 107 feet. The course is measured and he drives it. Let’s assume it took 18 seconds (4mph).
2. Park the sprayer and at the same engine speed and pressure, collect the output of the three nozzles under the hood for 18 seconds. Combine the output of the three nozzles and measure. The combined total, for example 20 ounces, equals the application rate in GPA. In this case the hoods are applying at 20 GPA.
3. Next, with the sprayer running at the same engine speed and pressure, collect the output of the two post-directing nozzles. Combine the output from these two nozzles and measure. The combined total, for example 13 ounces, equals the application rate in GPA. In this case the post directing nozzles are applying at 13 GPA.
4. Remember, you want the application rate to be the same for both the post-directed and hooded application. To accomplish this, decide which application rate fits your particular needs. In this example we will assume that 13 GPA post-directed is ideal. To get your hooded application to be 13 GPA instead of 20 GPA, reduce the size of the spray tips under the hood and re-run the calibration procedure. Continue this process until your hooded application rate and post-directed application rate are similar.
Scenario 2. Two pumps applying separate tank mixes.

1. The distance to travel for a 38 inch row is 107 feet. The course is measured and he drives it. Let’s assume it took 18 seconds (4mph).

2. Park the sprayer and at the same engine speed and pressure, collect the output of the three nozzles under the hood for 18 seconds. Combine the output of the three nozzles and measure. The combined total, for example 18 ounces, equals the application rate in GPA. In this case the hoods are applying at 18 GPA.

3. Next, with the sprayer running at the same engine speed and pressure, collect the output of the two post-directing nozzles. Combine the output from these two nozzles and measure. The combined total, for example 15 ounces, equals the application rate in GPA. In this case the post directing nozzles are applying at 15 GPA.

4. Remember, you want the application rate to be the same for both the post-directed and hooded application. To accomplish this, decide which application rate fits your particular needs. In this example we will assume that 15 GPA post-directed is ideal. To get your hooded application to be 15 GPA instead of 18 GPA, you have two options. First reduce the pressure for the pump applying under the hood. Caution: Be sure that after reducing the pressure the spray tip still produces an acceptable spray pattern. Re-run the calibration procedure. Continue this process until your hooded application rate and post-directed application rate are similar. The second option is to change to a smaller spray tip size under the hood to reduce the application rate to 15 GPA. Then re-run the calibration procedure. Continue this process until your hooded application rate and post-directed application rate are similar.
